Hasselöv and Kaegi 2008

Nano or not???

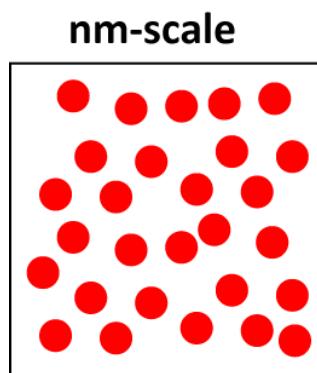

Laboratory vs. environment

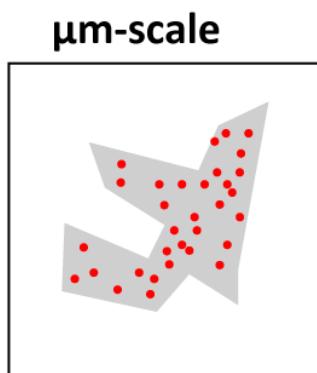

release
(LCA, are the NP released as individual NP or as 'composite' particles?)

transport

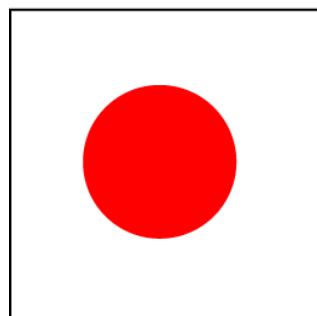

exposure & hazard
that what forms of NP are we exposed and is there a hazard

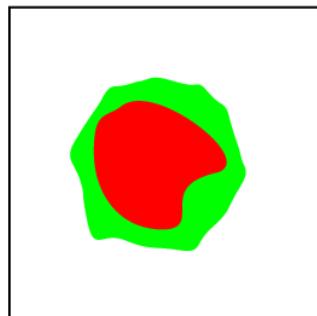

vs.

pure NP

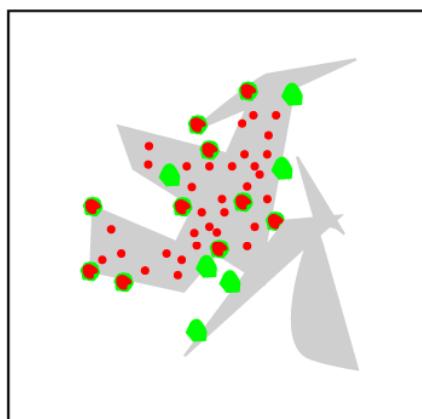

vs.

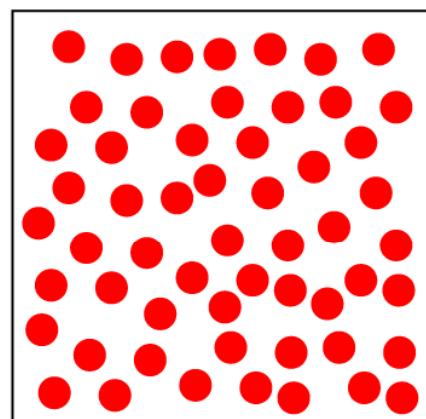

'reacted'

μm-scale

vs.

reality?

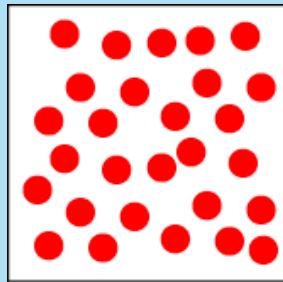

Lab scale experiments are based on 'the red dot system', risk assessments are based on lab experiments, and decisions are made based on risk assessments. Is this a reasonable approach for NP?

Analytical challenges

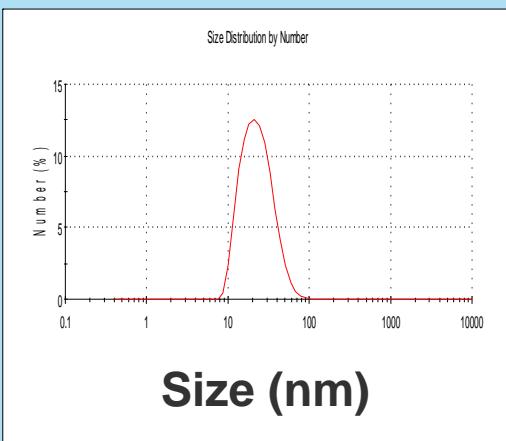

- ***discriminate*** between natural ,NP' (colloids) and ENP.
- ***detect*** ENP in complex colloids.

(Ag-NP)

Laboratory

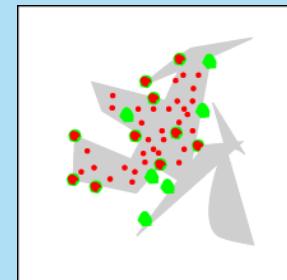

DLS (dynamic lightscattering)

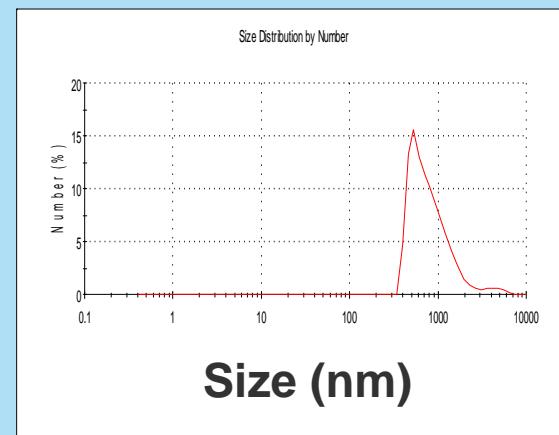

ICPMS

250 ppm Ag

Environment

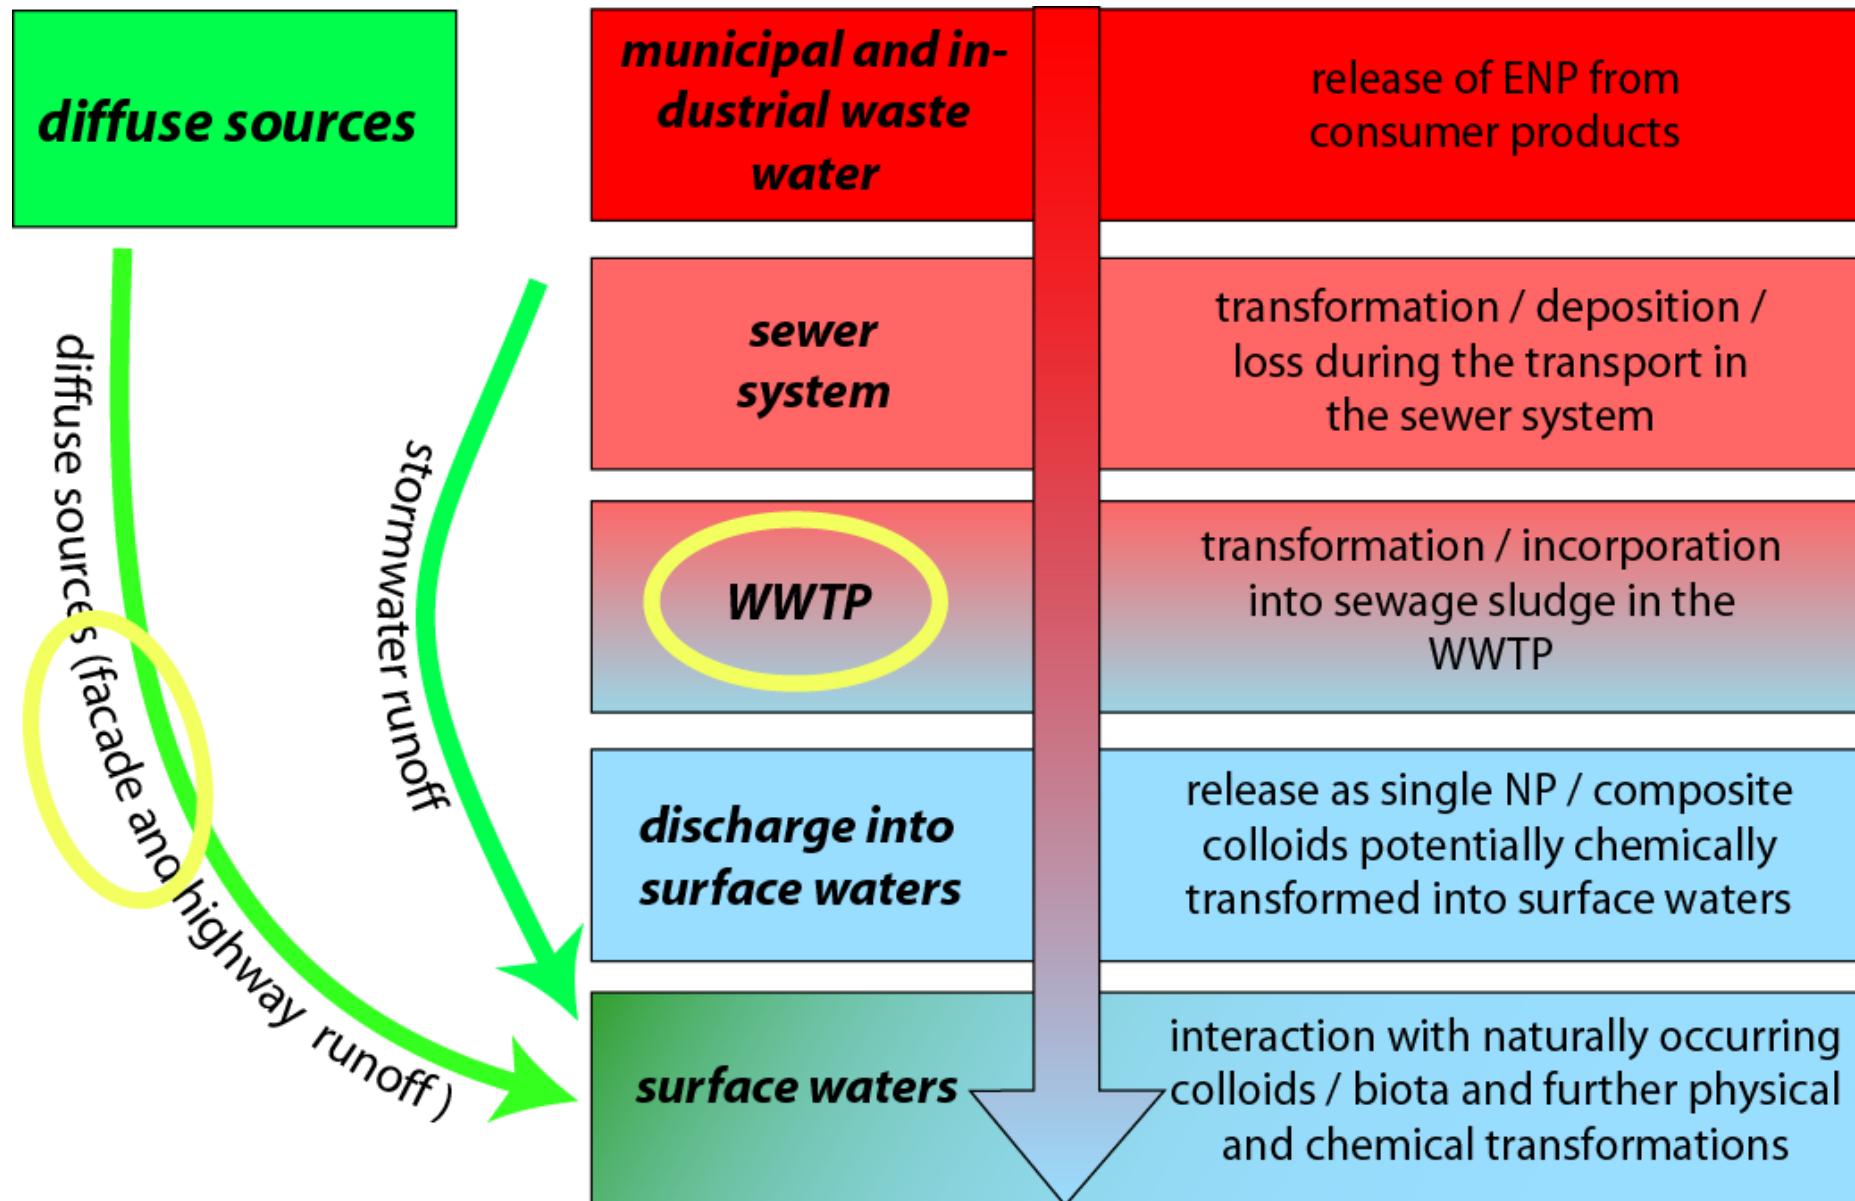

DLS

ICPMS

10 ppb Ag

ENP in the urban watercycle

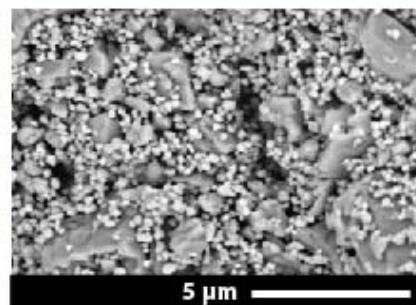

Runoff from facades I: TEM and ICP-MS

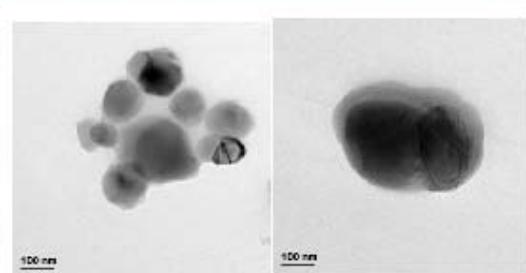

Kaegi et al., Env. Poll. 156, 233

New facade (1.3 m²)

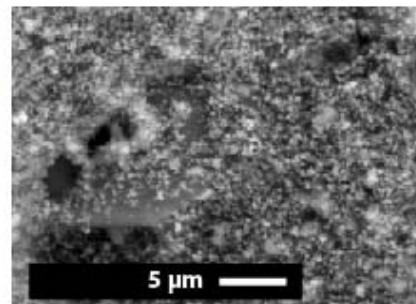

SEM(BSE) image of the new facade

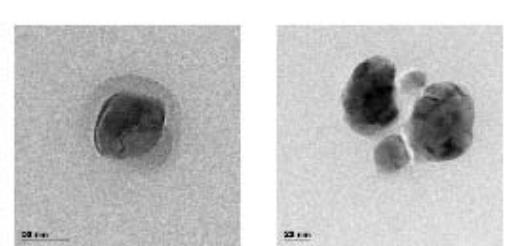

TEM-images of the facade runoff (new facade)

Building facade (painted with the same product as the new facade)

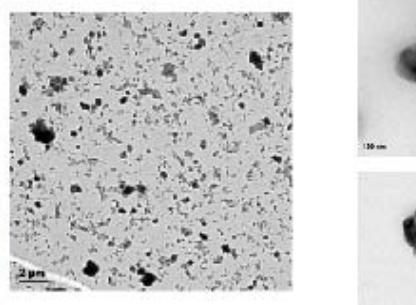

SEM(BSE) image of the new facade

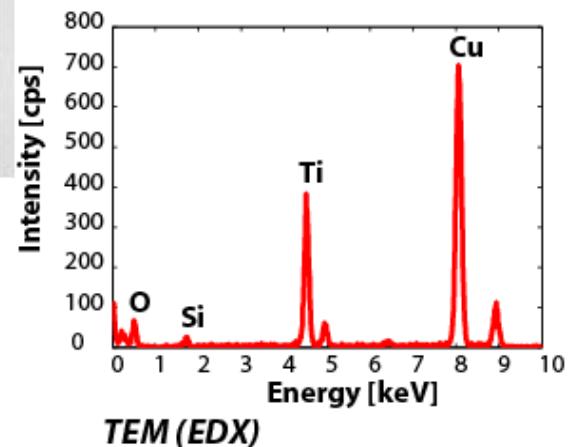

TEM-images of the facade runoff (aged facade)

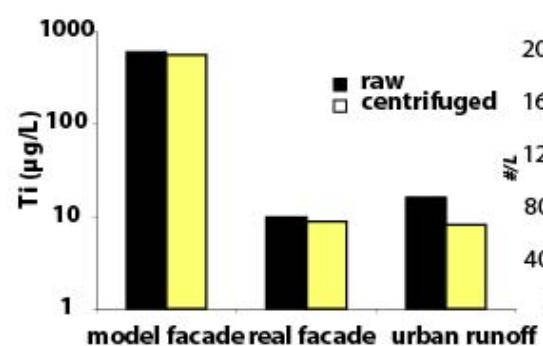

Discharge of the runoff into the urban creek

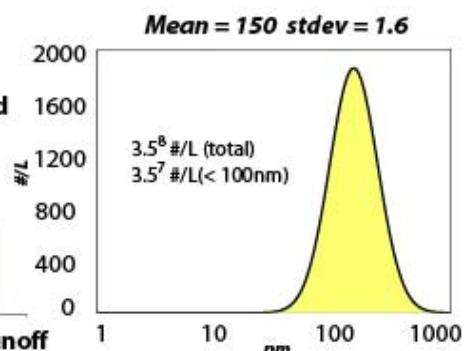

TEM-images of the runoff

TEM (EDX)

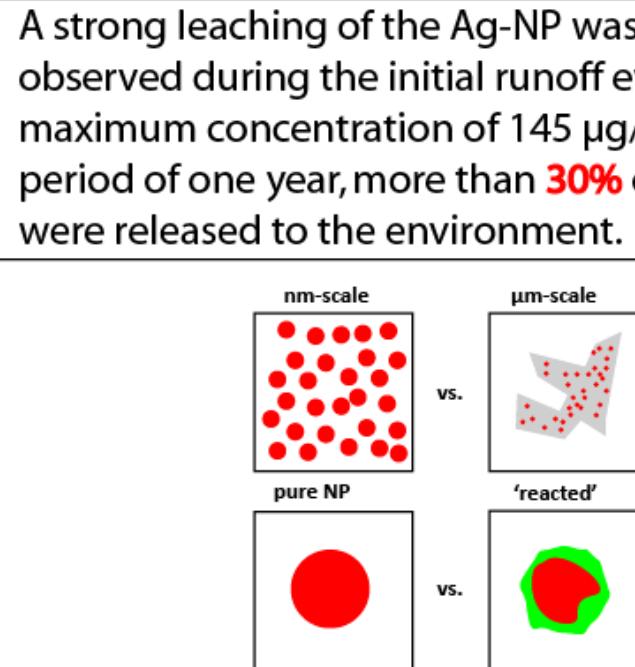

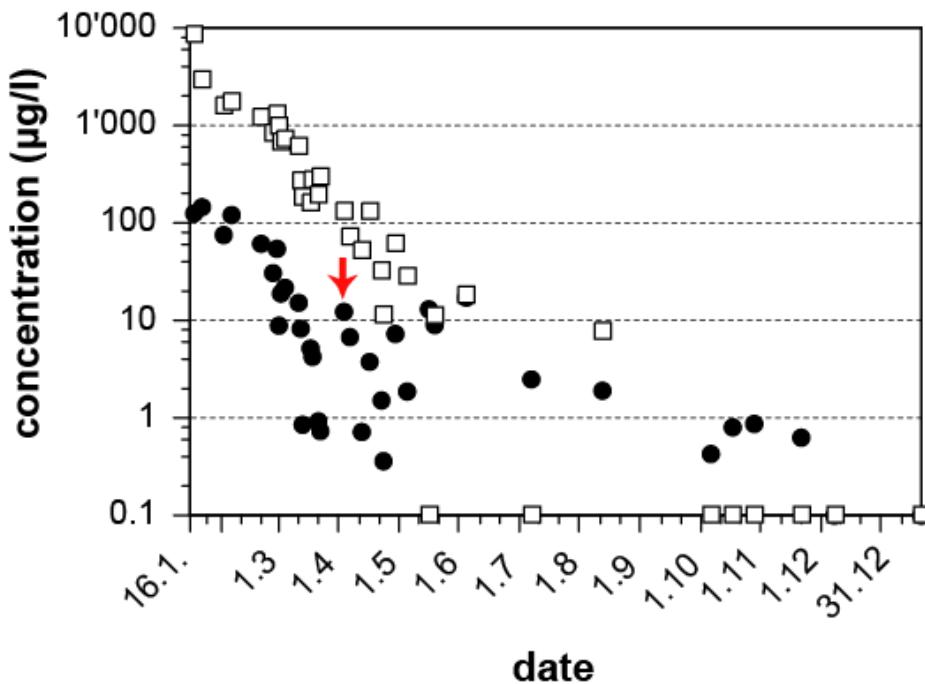

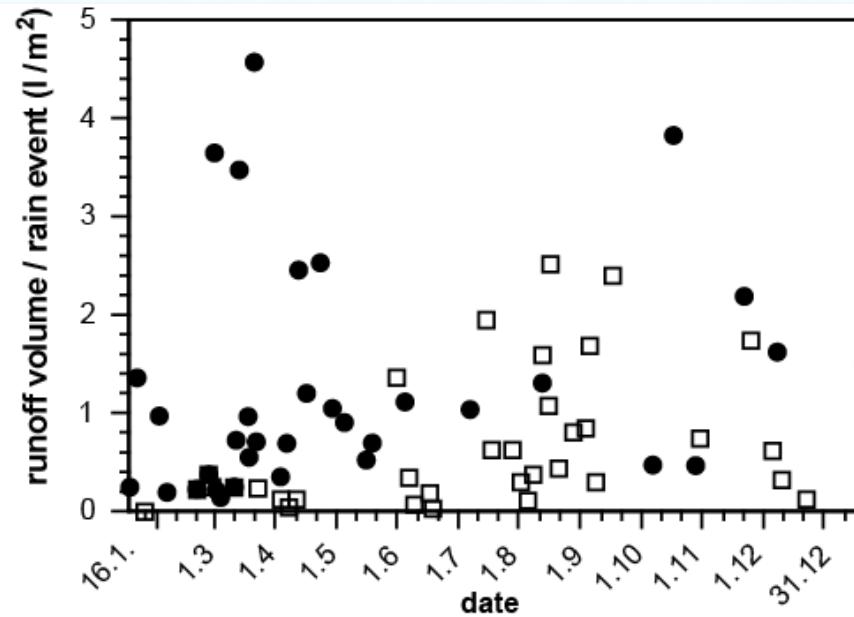

Ti concentrations in the raw and in the centrifuged samples (ICP-MS)

Modeled log-normal distribution of the TiO_2 particles in the runoff.

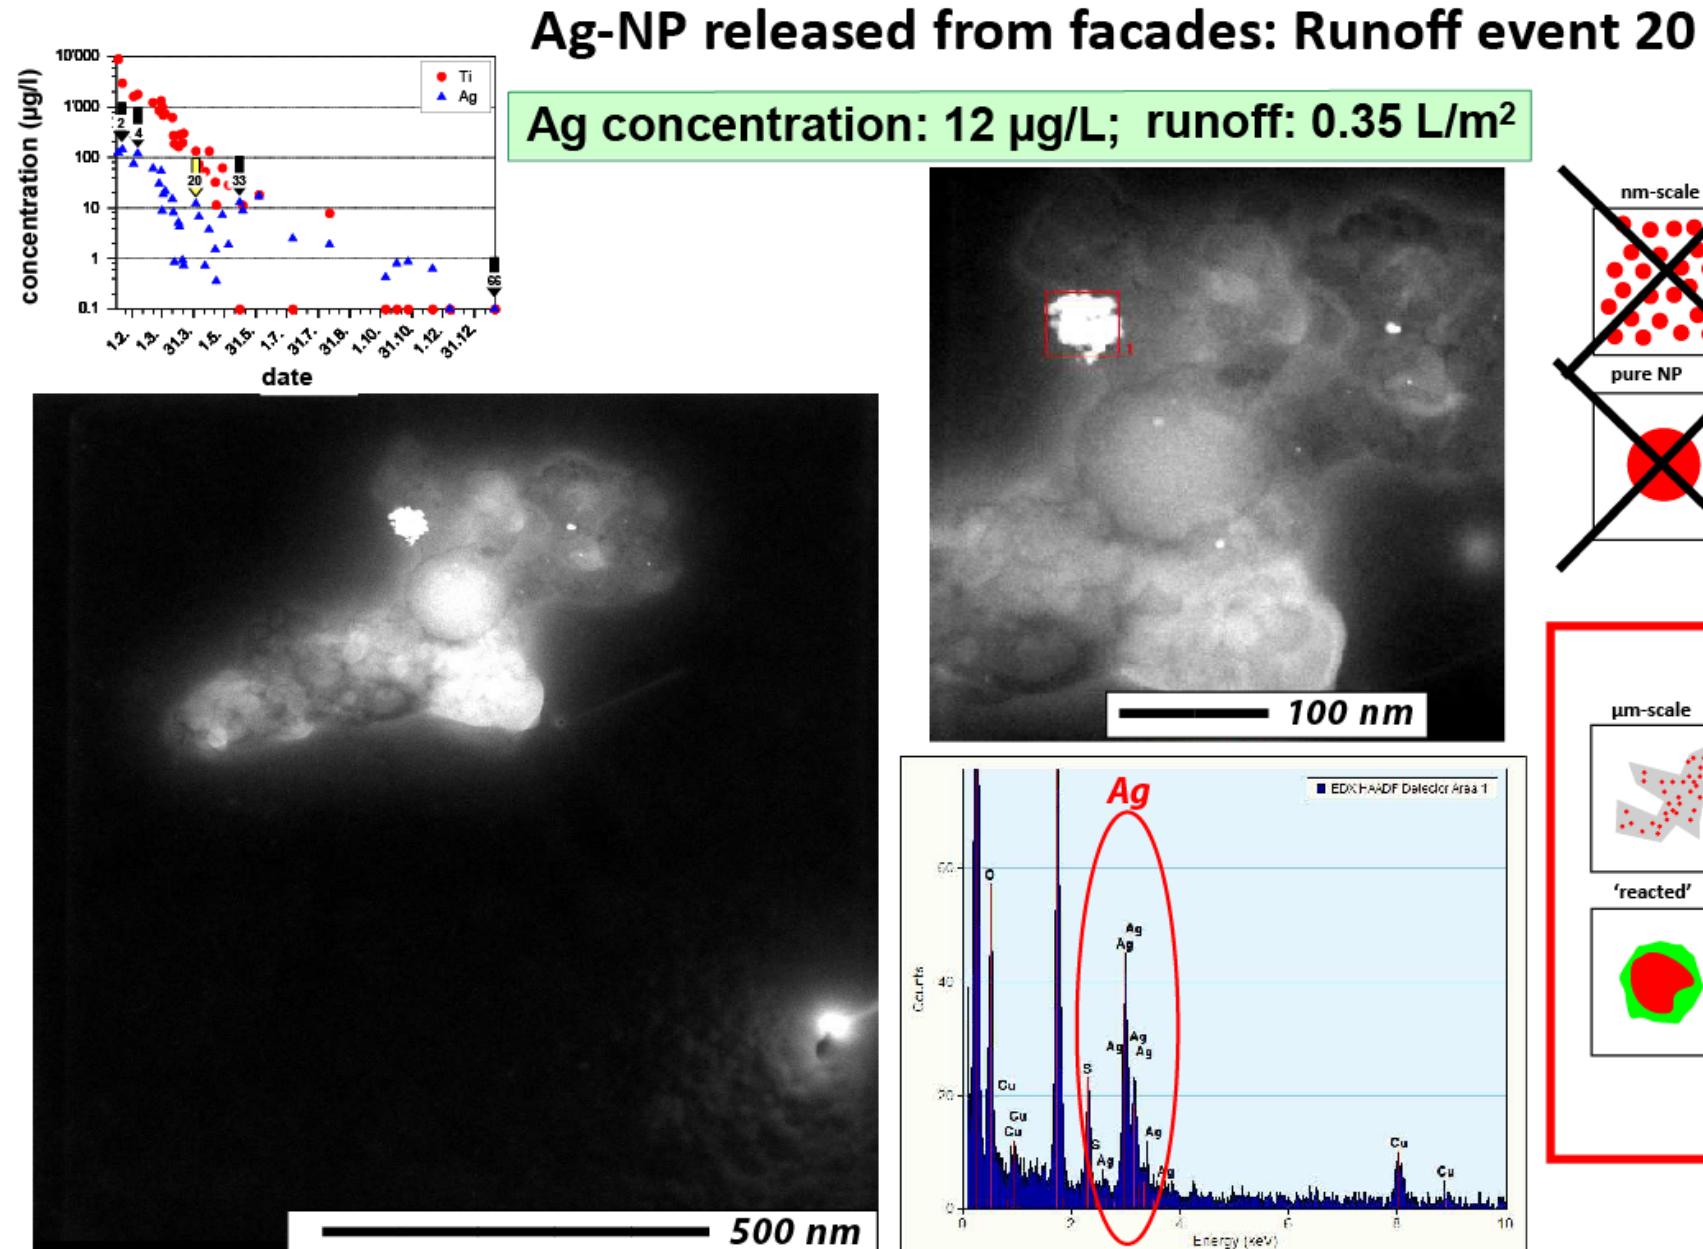

Runoff from facades II: (more) TEM and ICP-MS

Kaegi et al (2010), Env. Pol., 158,(9), 2900-2905

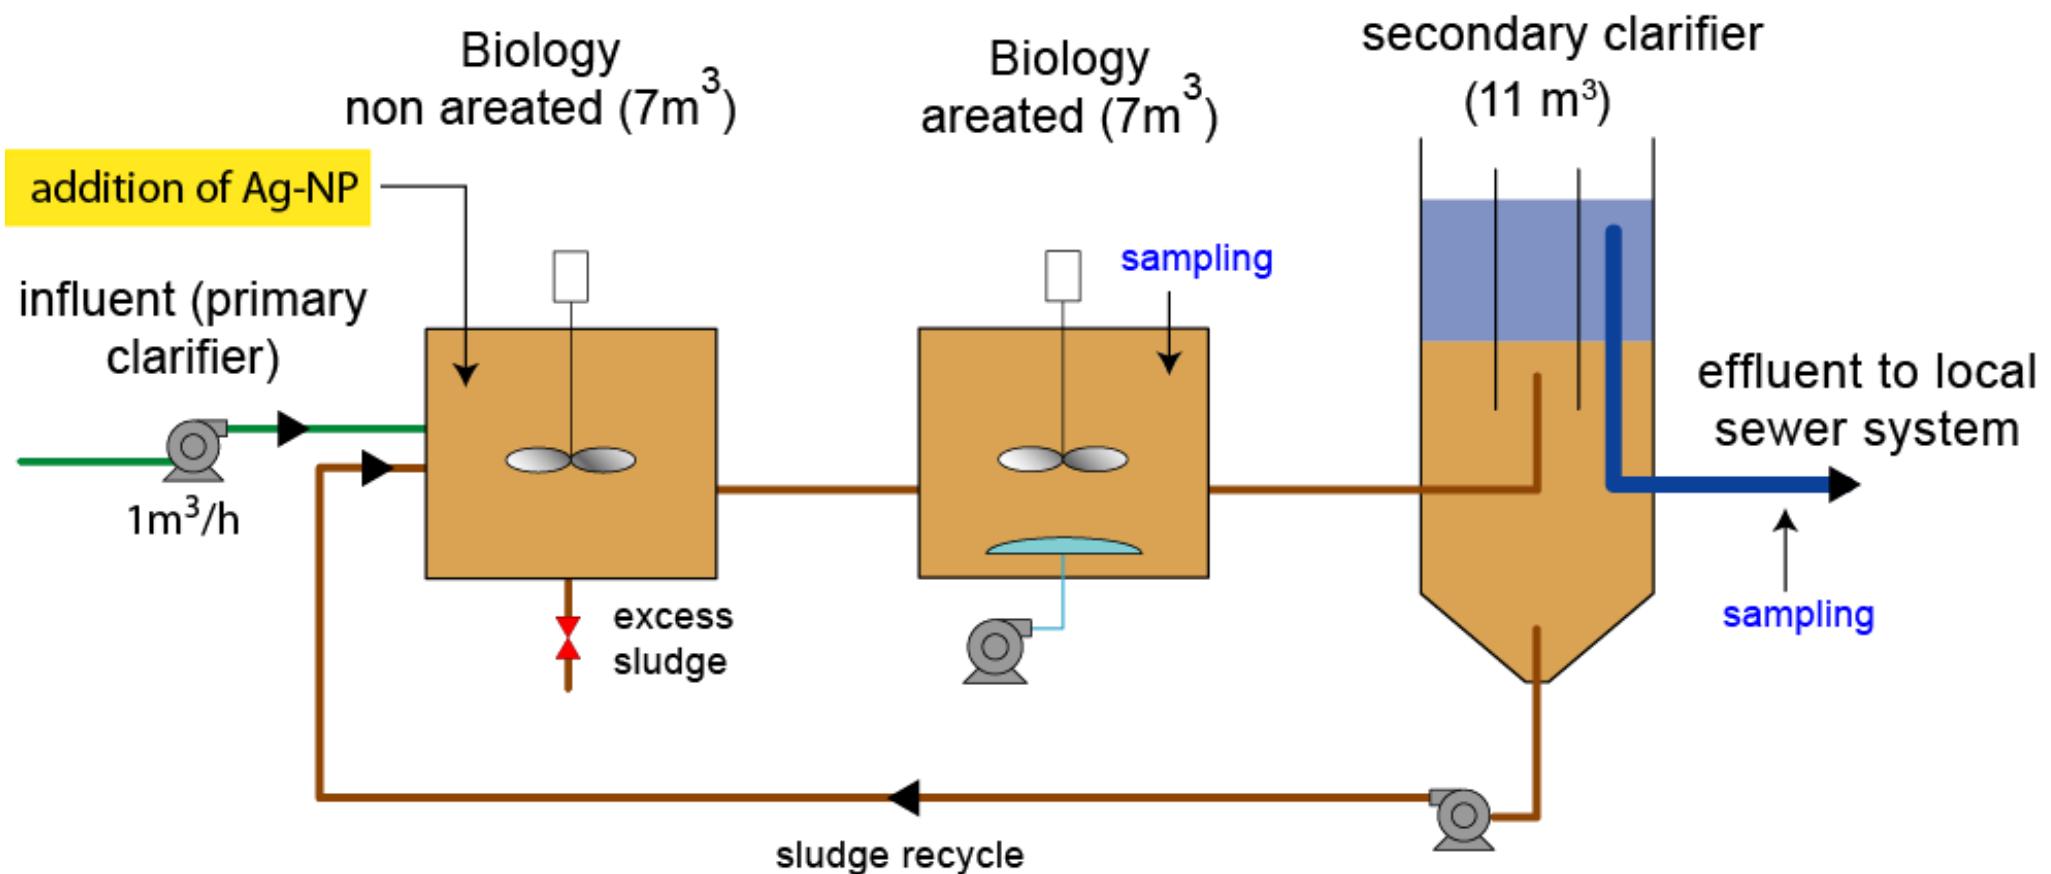

A strong leaching of the Ag-NP was observed during the initial runoff events with a maximum concentration of 145 µg/l Ag. After a period of one year, more than 30% of the Ag-NP were released to the environment.

Ag-NP in composite colloids

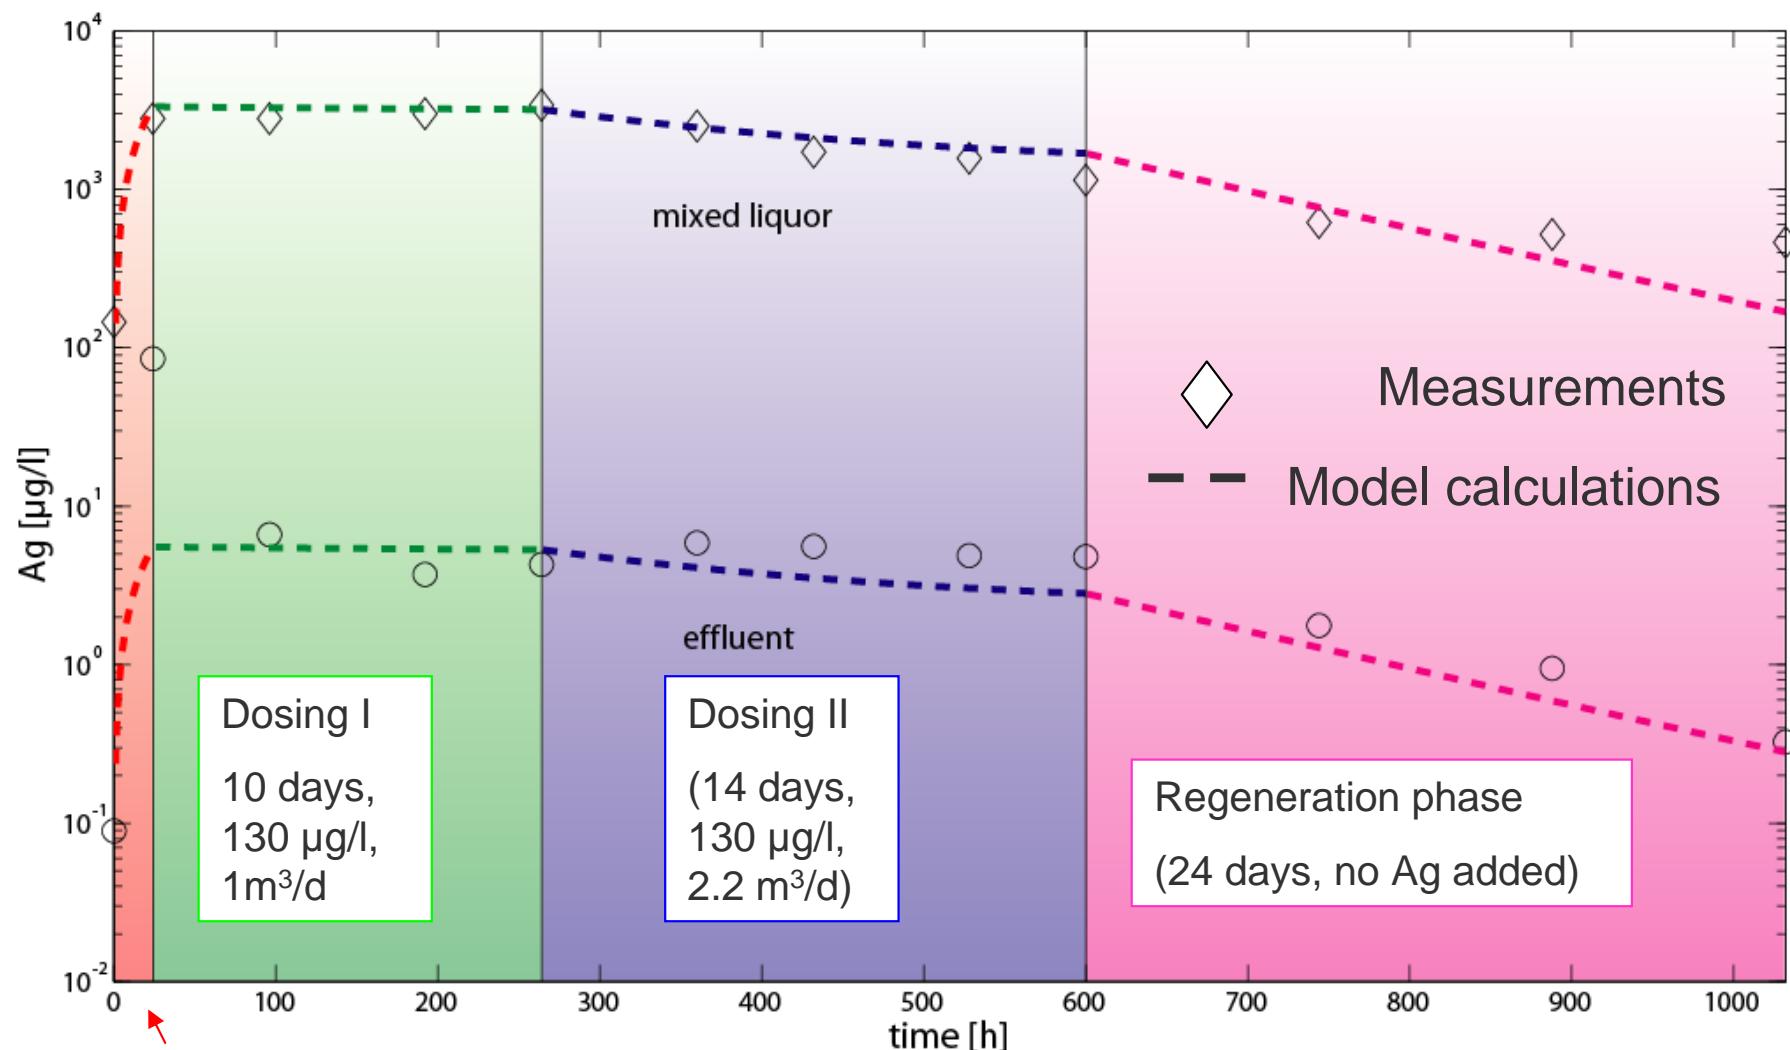

Wastewater treatment: TEM, ICP-MS and XAS, and some common sense

Experimental setup I

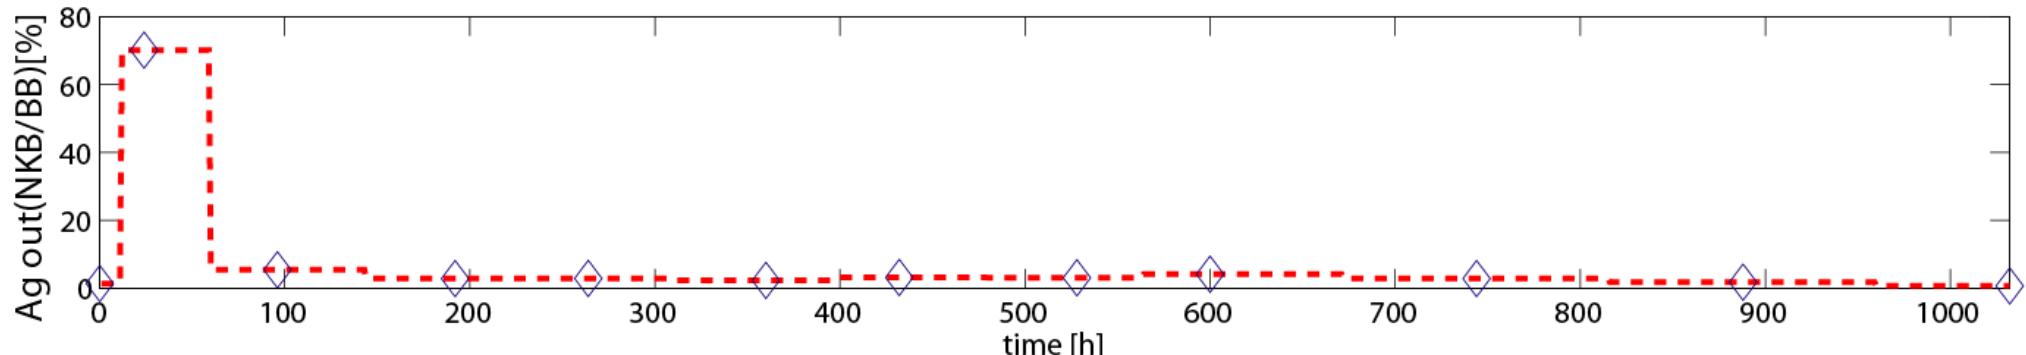

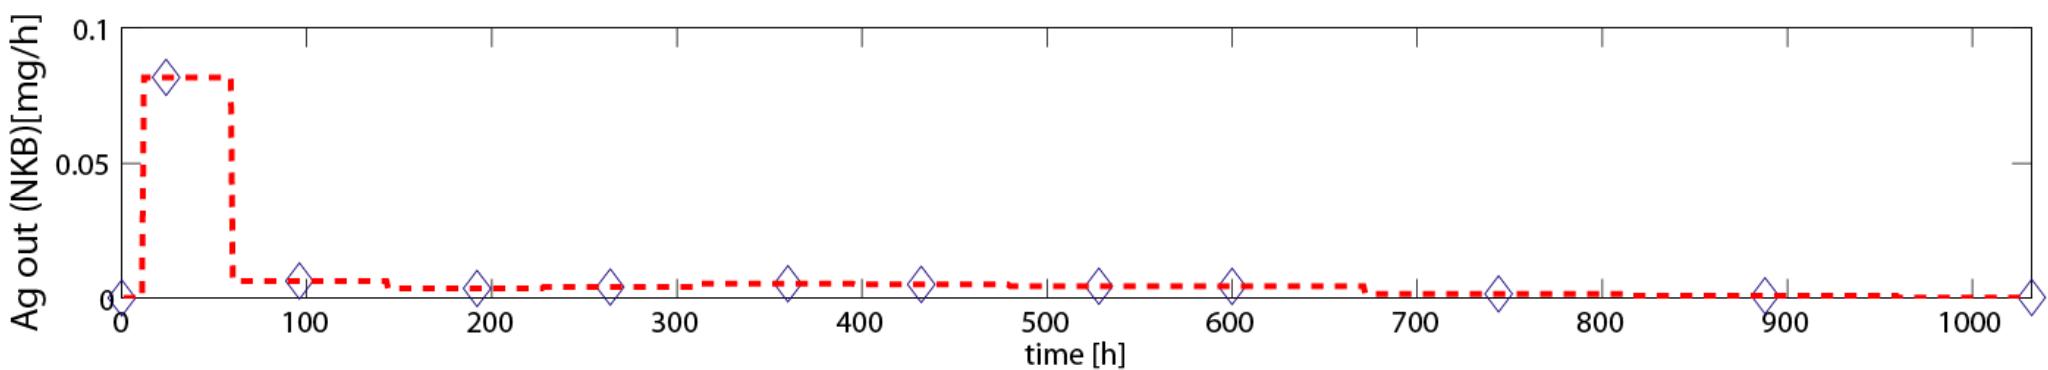

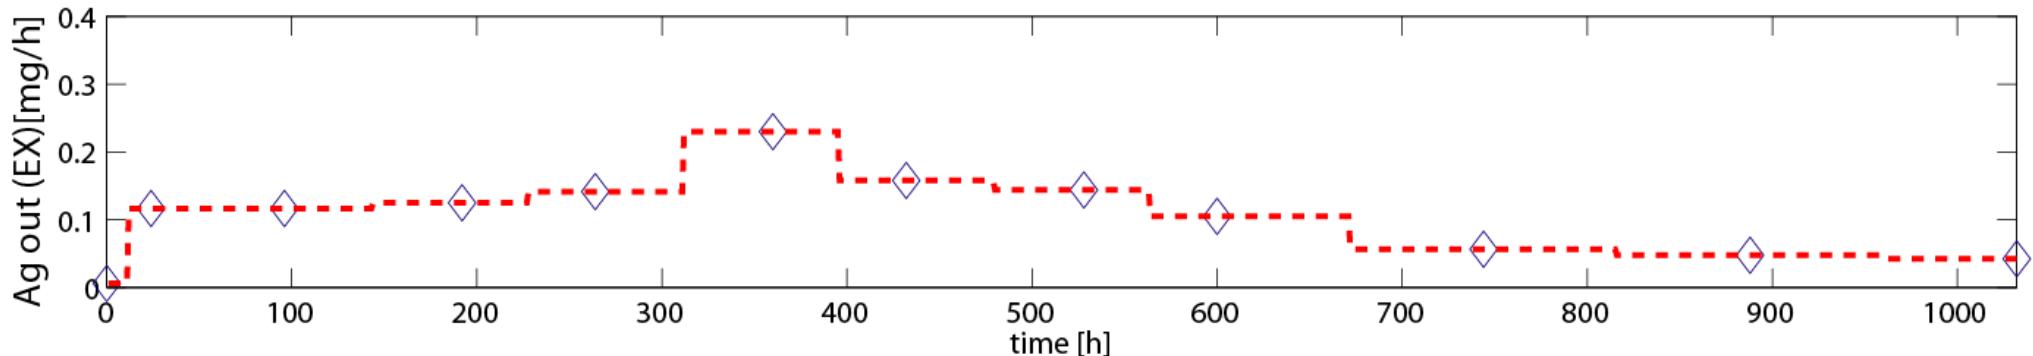

Experimental setup II and model calculations

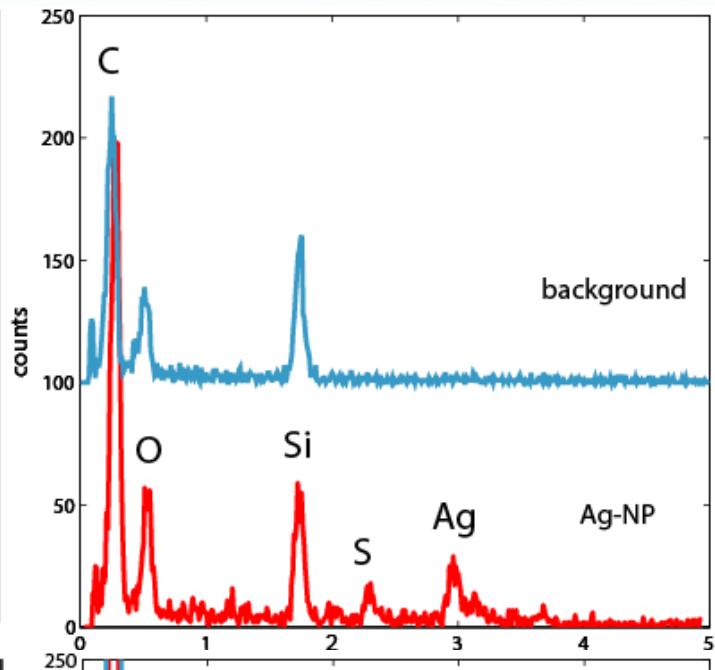

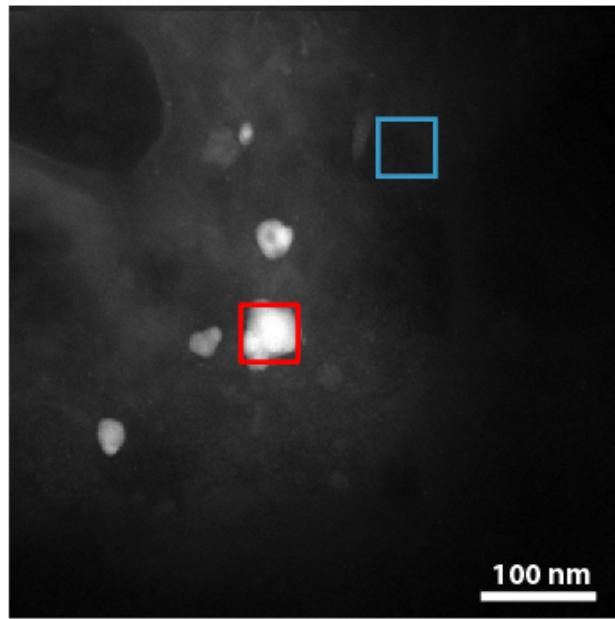

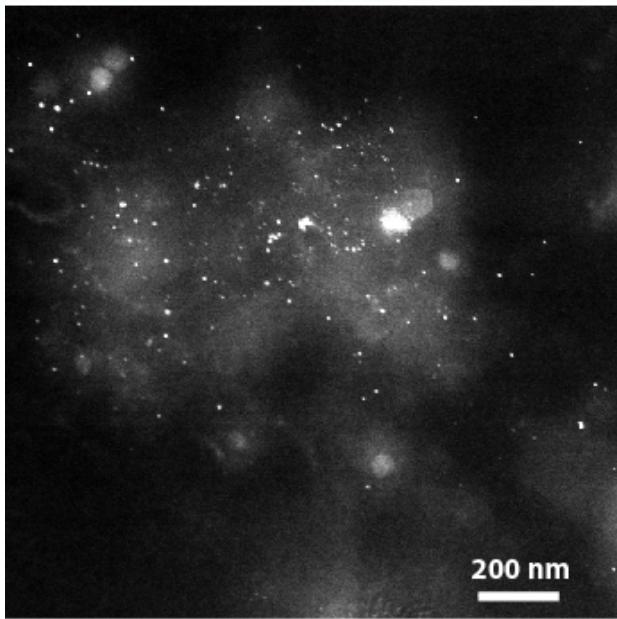

Initial spike (1 day, 2400 $\mu\text{g/l}$)

Mass flux of Ag

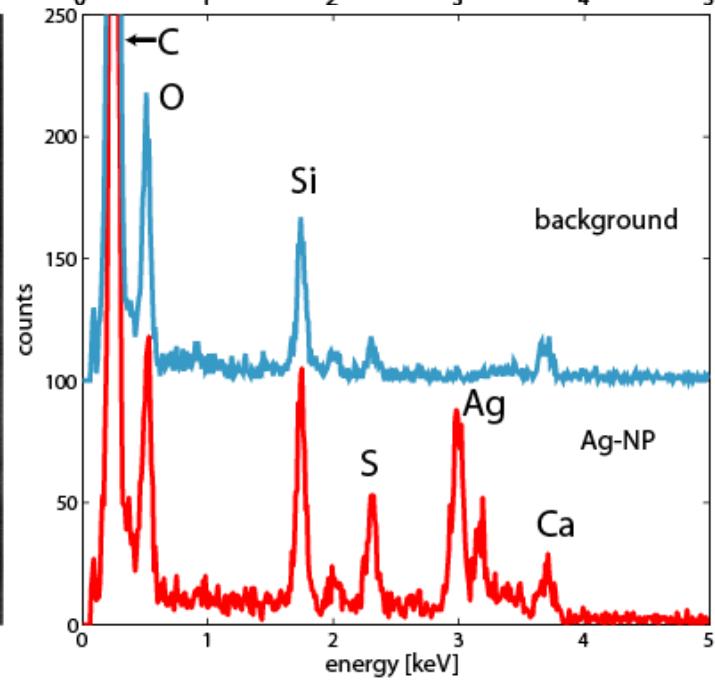

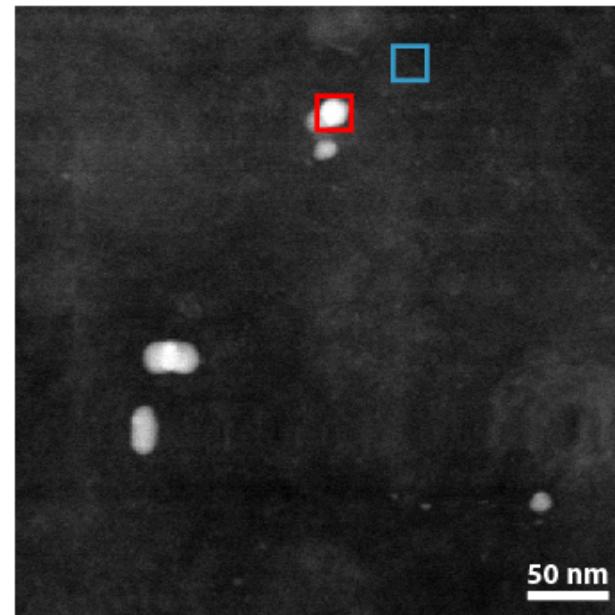

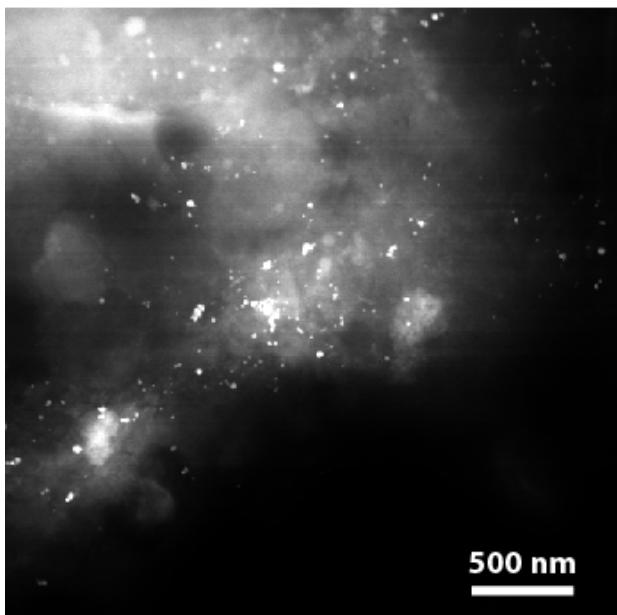

TEM: HAADF and EDX

Aerated tank

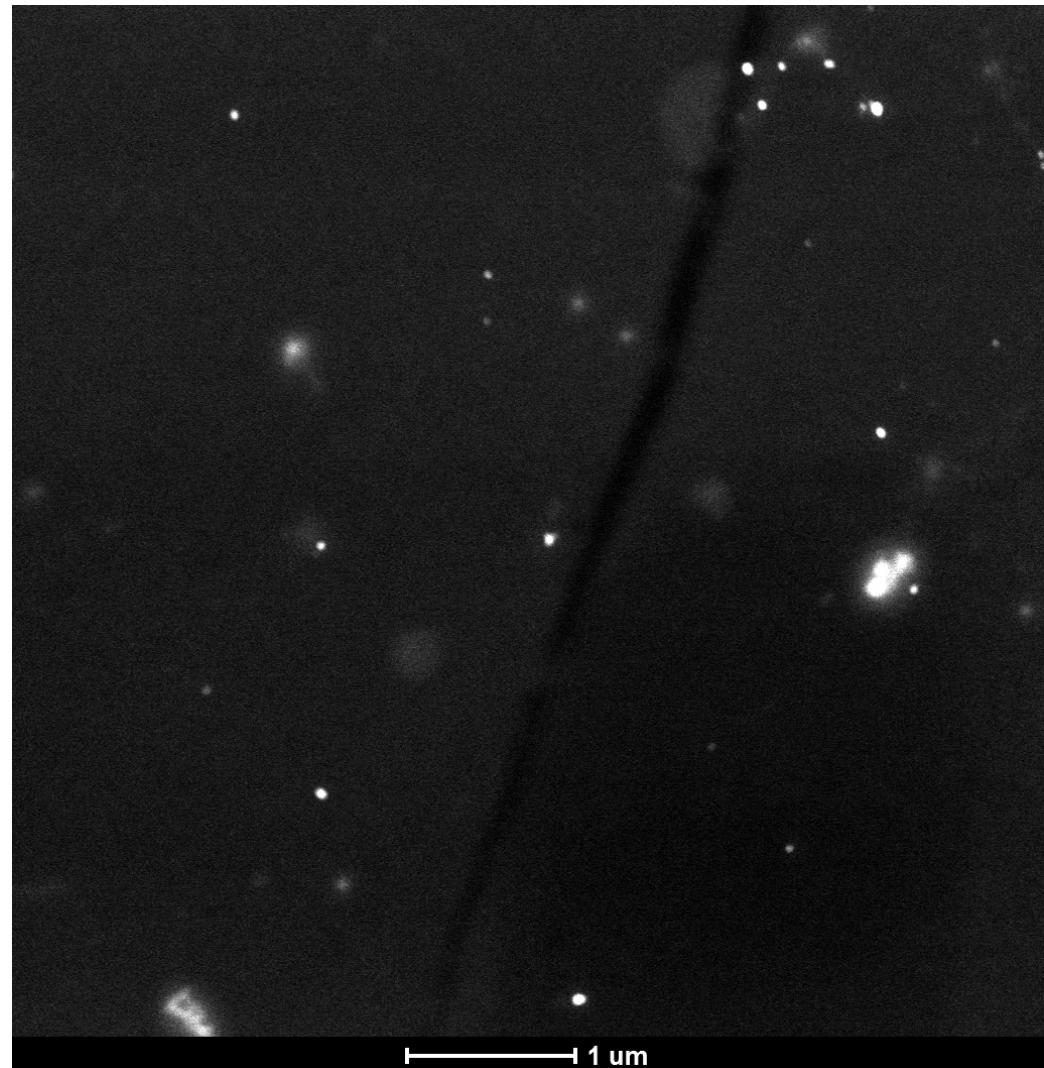

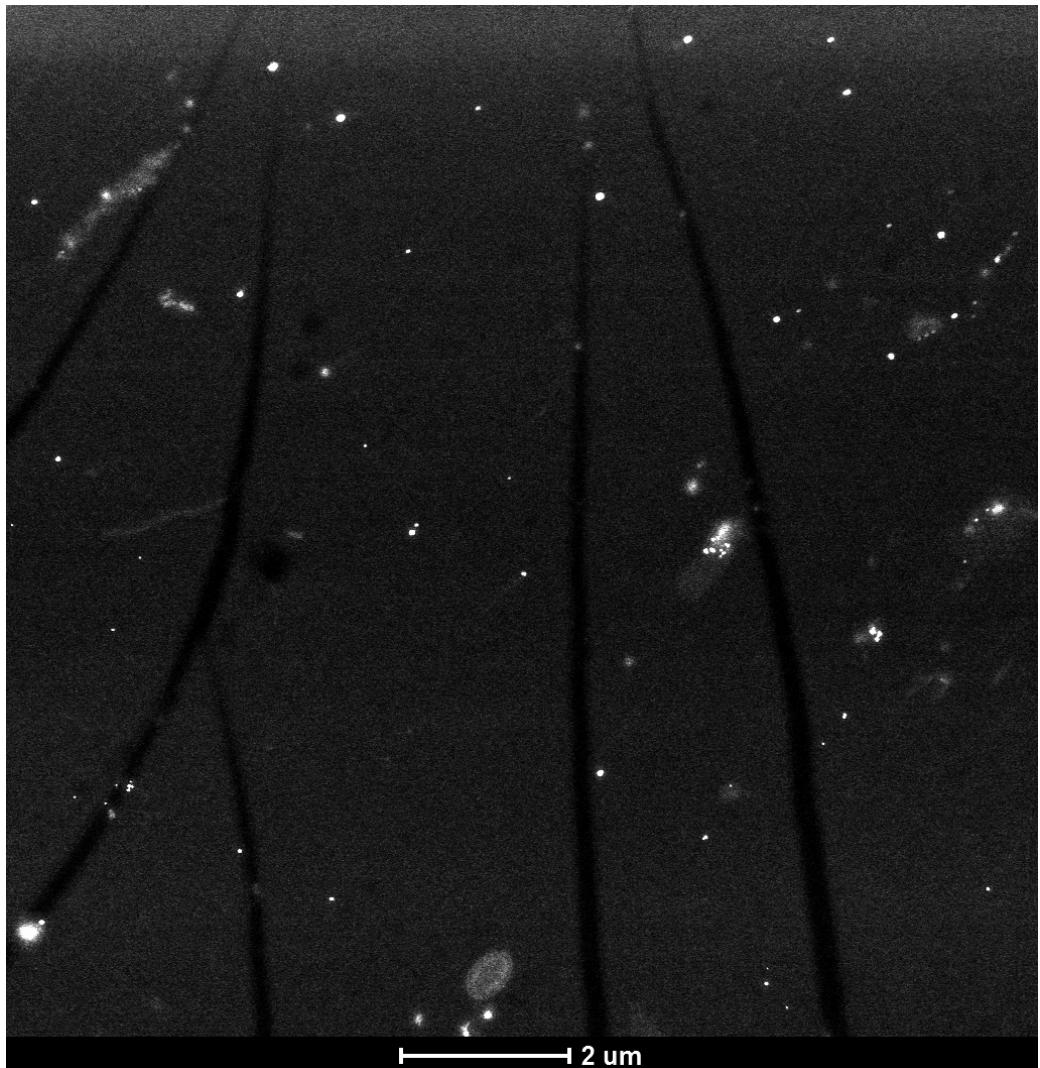

Secondary clarifier

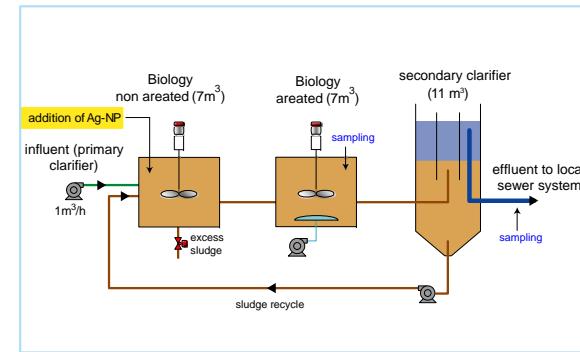

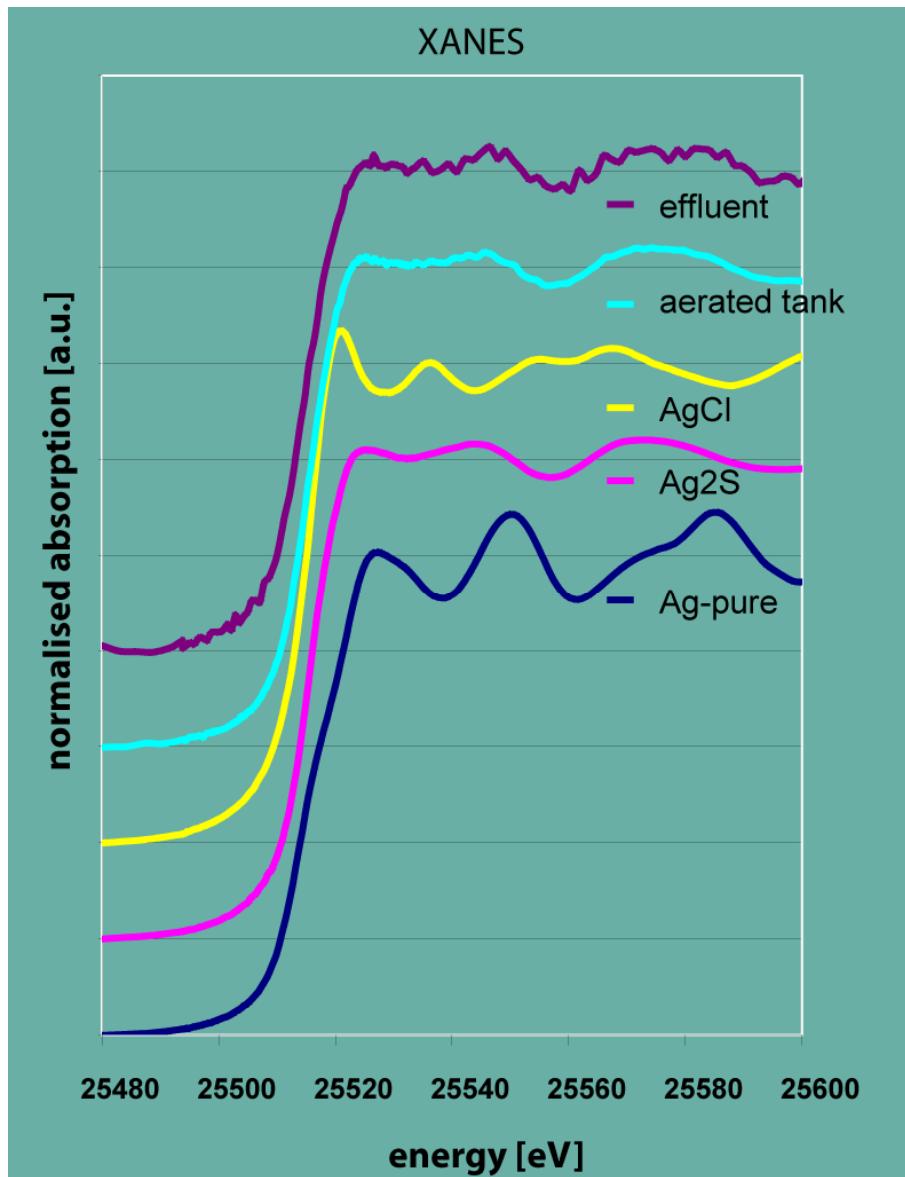

TEM: HAADF

Secondary califier after the initial dosage

Speciation of Ag: XANES

XAS performed on bulk samples allows determining the speciation of the Ag. For that purpose, measured spectra are combined with spectra from reference materials (linear combination fitting)

LCF XANES

	Ag-pure	Ag ₂ S	Sum	R-value
Pilot - ARA				
aerated tank	2%	98%	100%	0.00007
effluent	15%	87%	101%	0.00050

Conclusions
