

# Influence of agricultural pesticide and urban biocide use on load dynamics in surface waters

Irene Wittmer, H.-P. Bader, R. Scheidegger, H. Singer, C. Stamm

# Overview

- Introduction
- Field study

- Modelling (briefly)
- Conclusions

# Introduction

What is a pesticide or a biocide?

Pesticide  
(plant protection)

Biocide  
(non-plant protection)

# Introduction

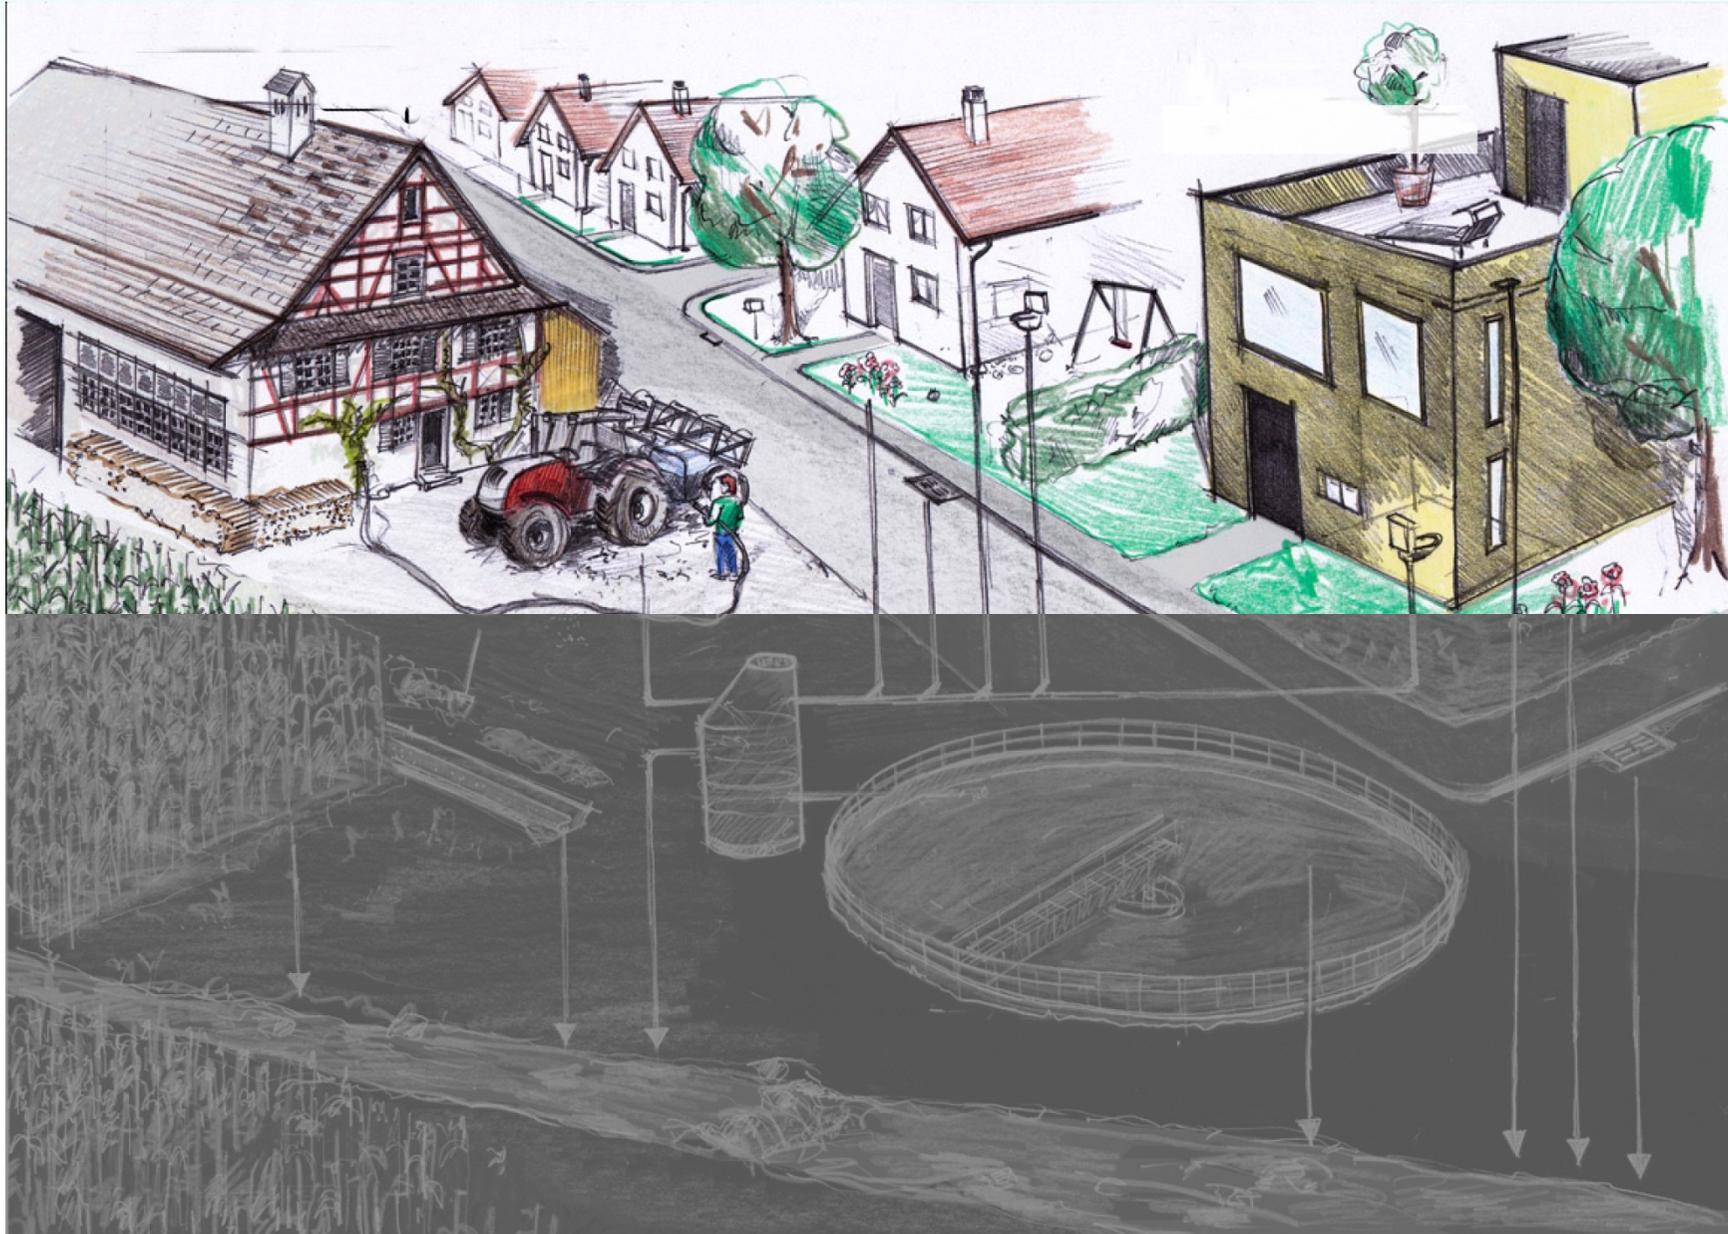

## Usage of pesticide and biocide

Irene Wittmer , Environmental monitoring of biocides, Berlin, Nov. 2012

## Studied compounds

Pesticides  
(agriculture)

**Carbendazim**

**Diazinon**

**Terbuthylazine**

**Isoproturon \***

**Mecoprop**

**Atrazine \***

**Sulcotrion**

**Mesotrion**

*Selected samples of:*

**Glyphosate \***

Biocides  
(urban)

**Carbendazim**

**Diazinon**

**Terbuthylazine**

**Isoproturon \***

**Mecoprop**

**Isothiazolinones**

**IPBC**

**Irgarol \***

**Diuron \***

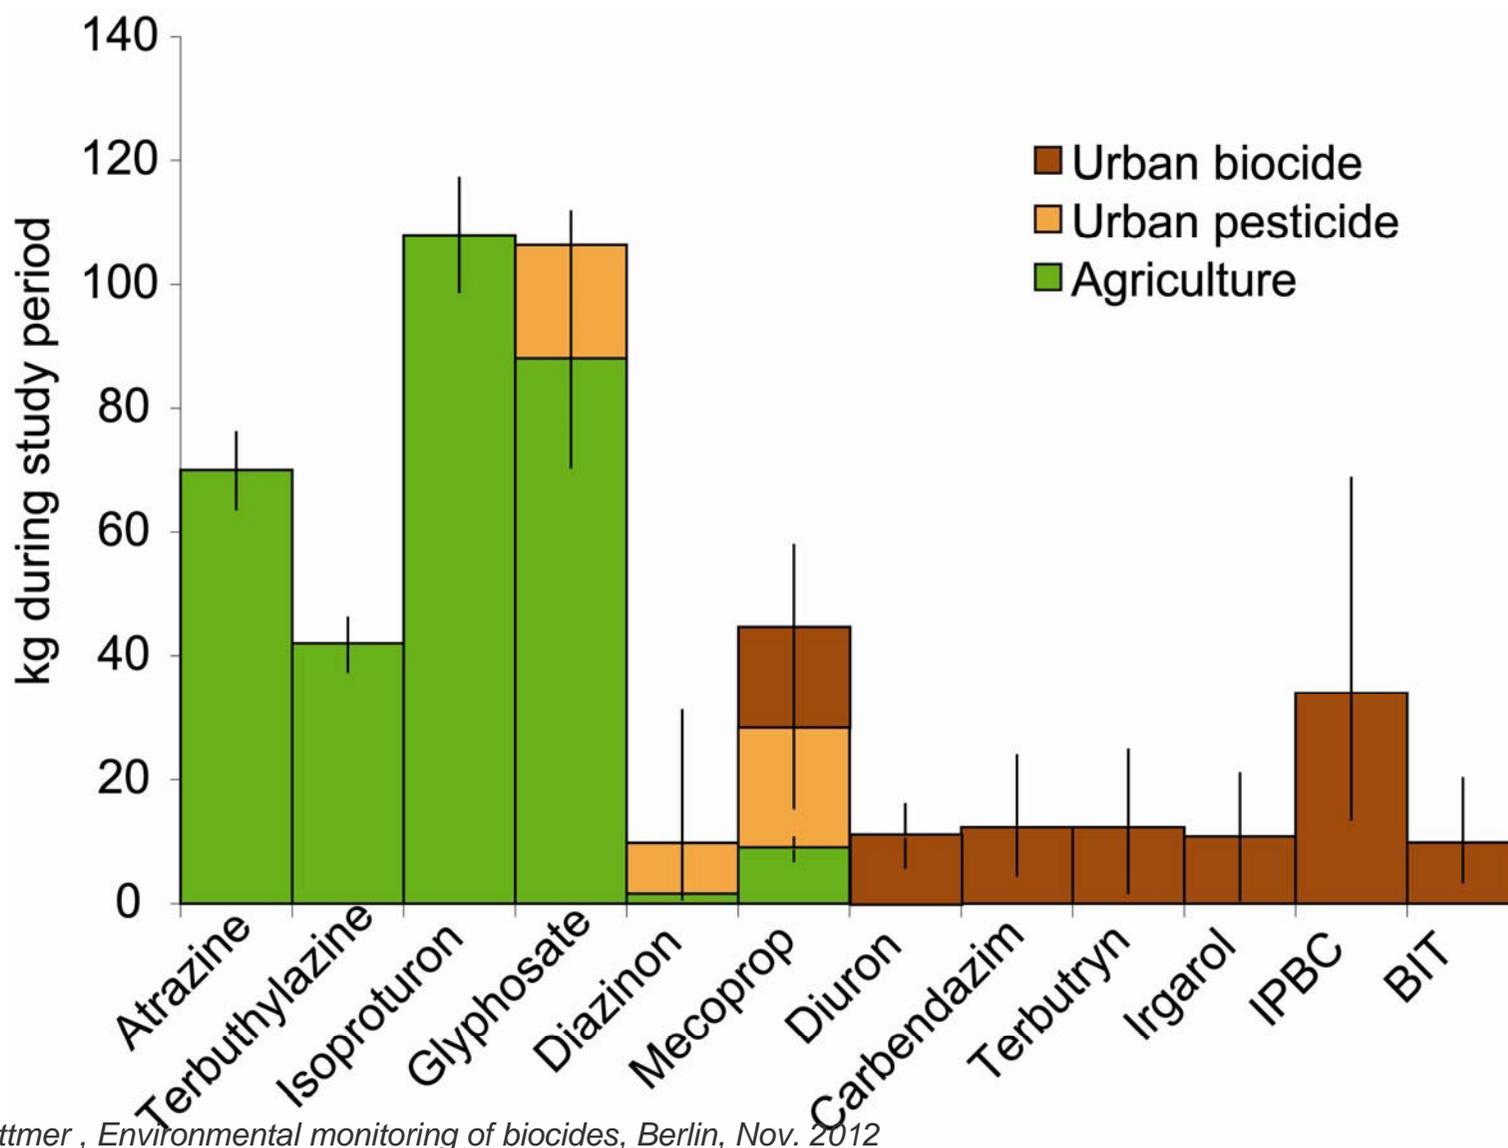

**Terbutryn \***

**Glyphosate \***

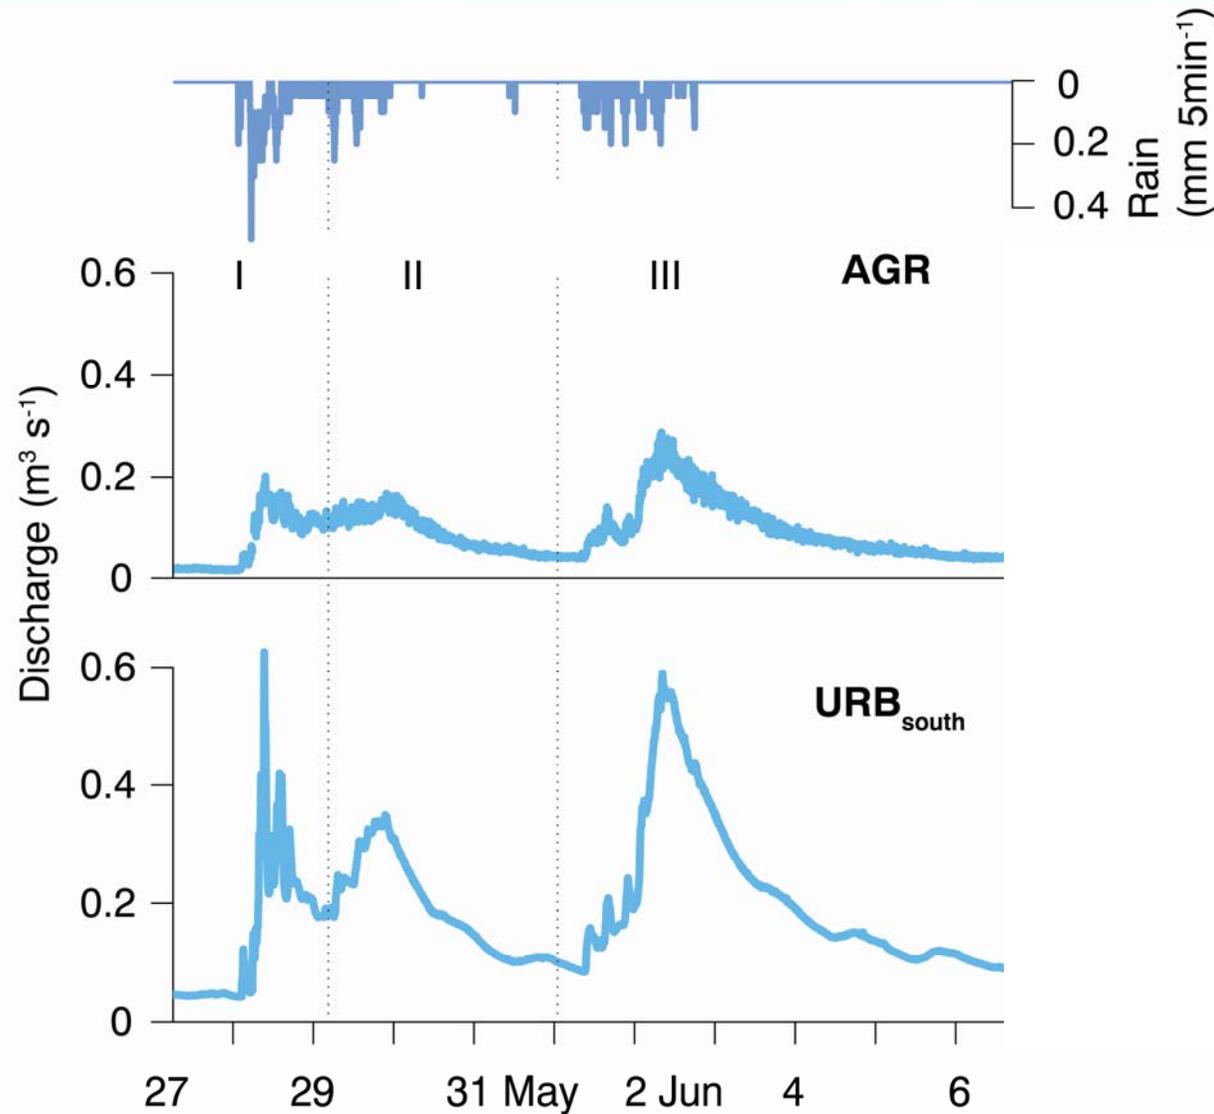

*\* plus metabolites*

## Consumption

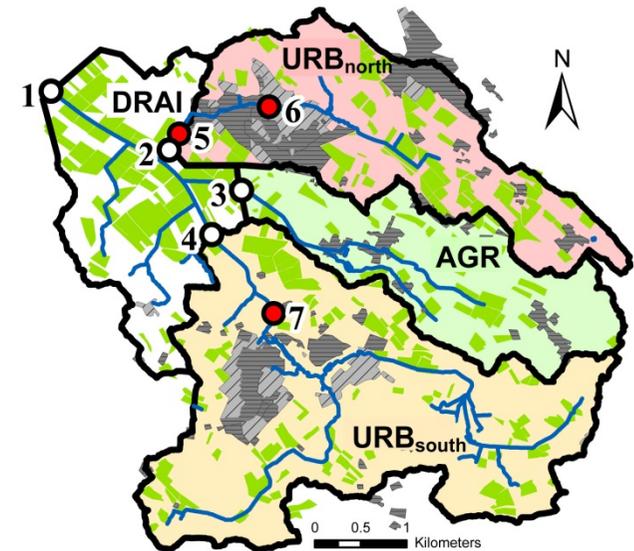

in the study catchment during the measurement period

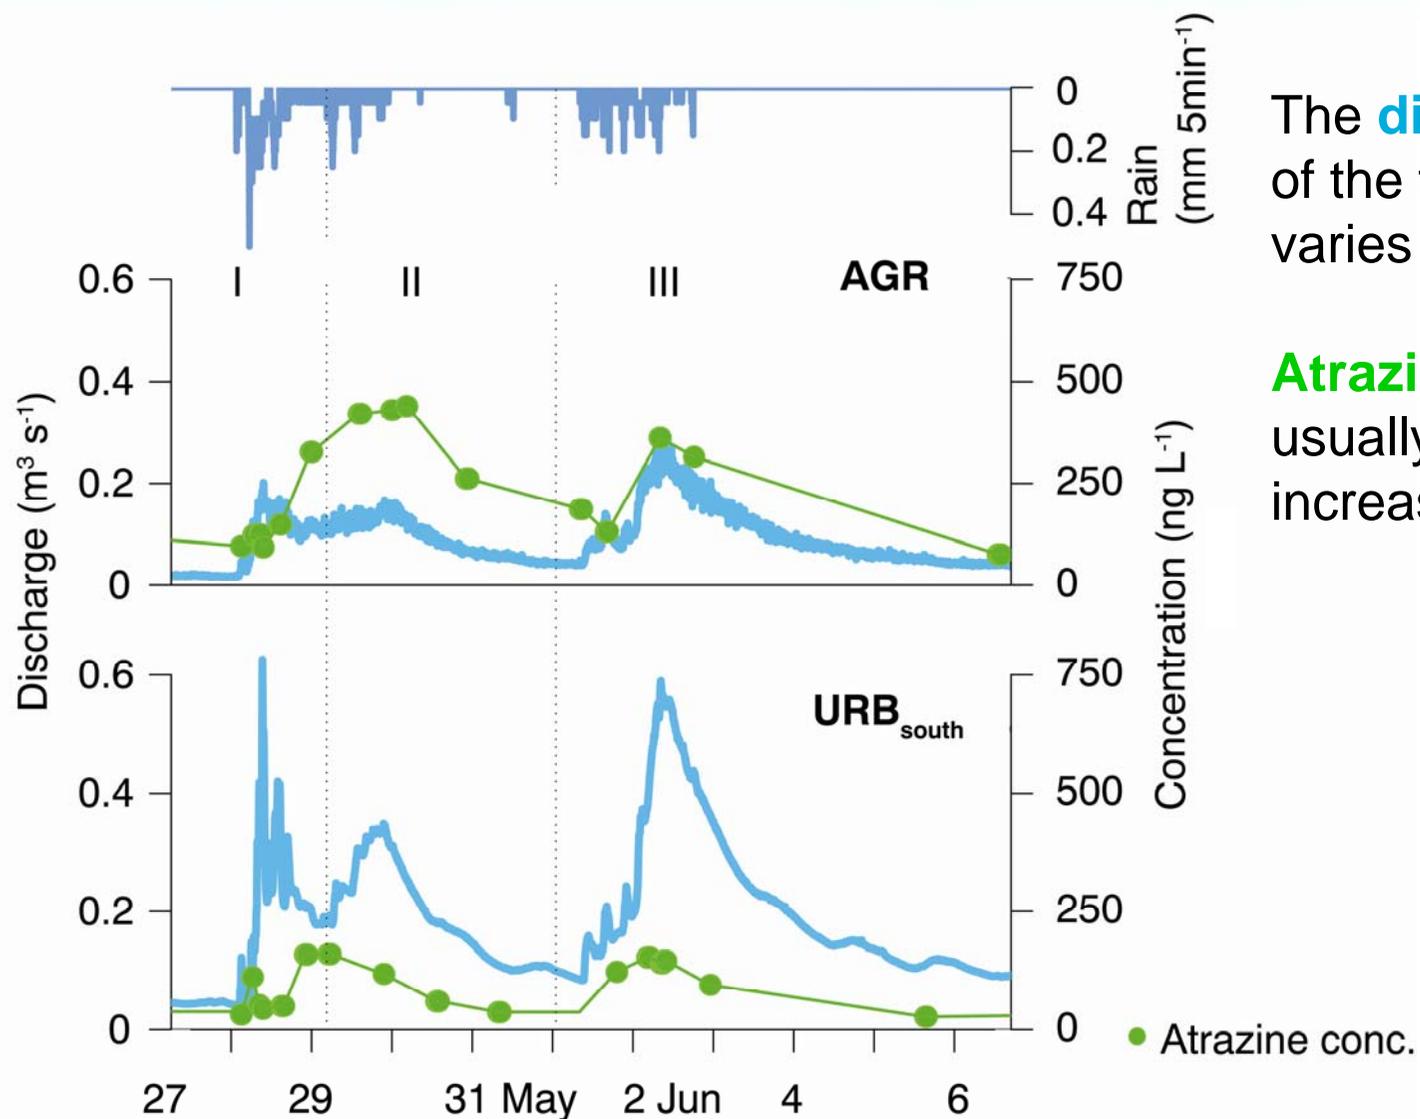

# Concentration dynamics

The **discharge dynamic** of the two catchments varies

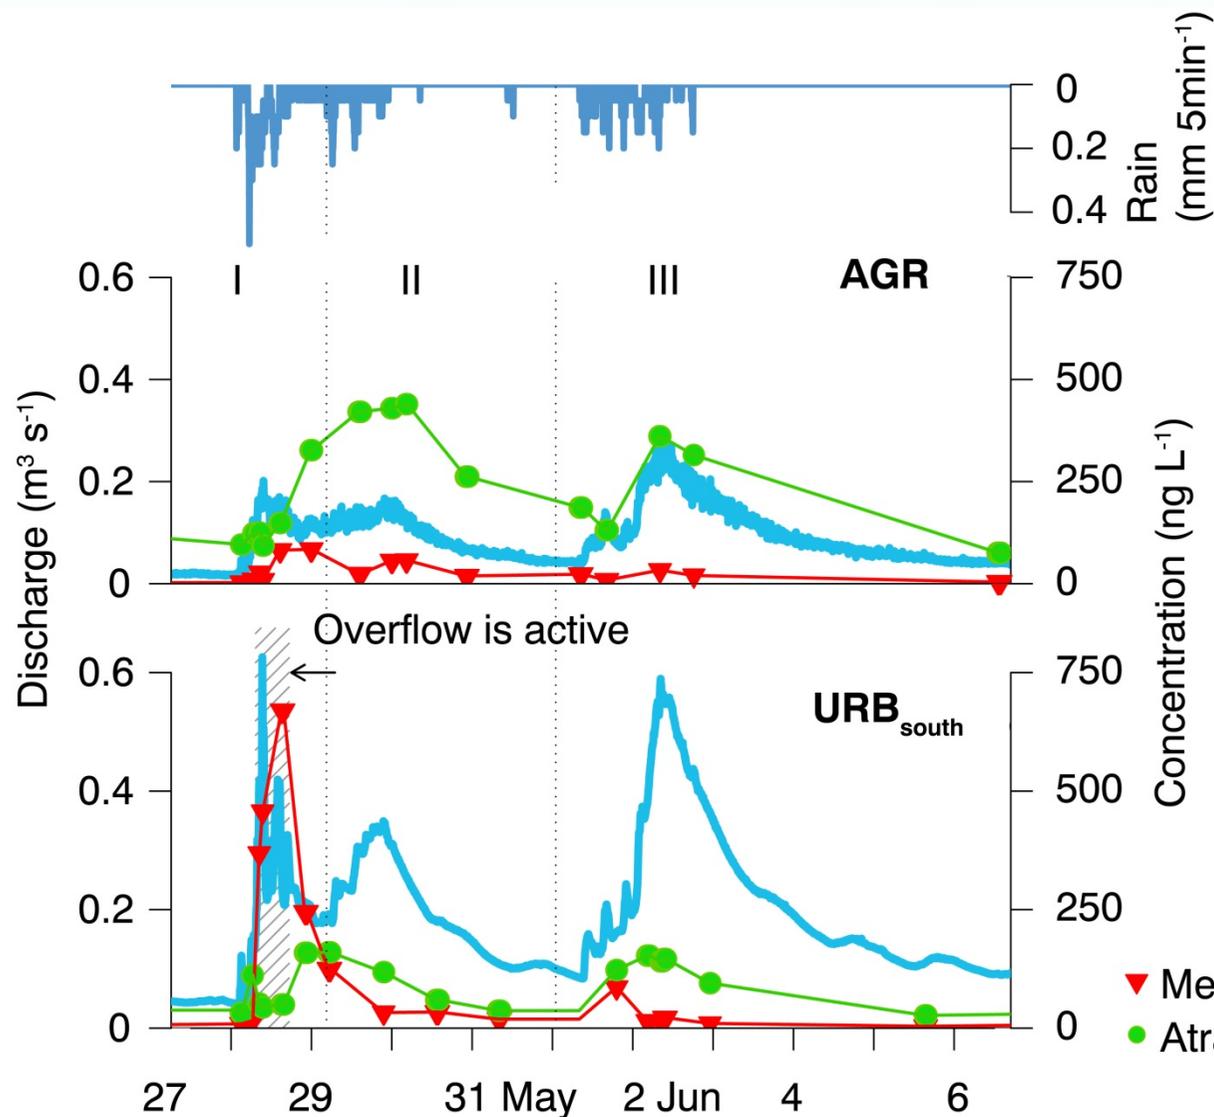

# Concentration dynamics

The **discharge dynamic** of the two catchments varies

**Atrazine**- concentrations usually increase with increasing discharge

# Concentration dynamics

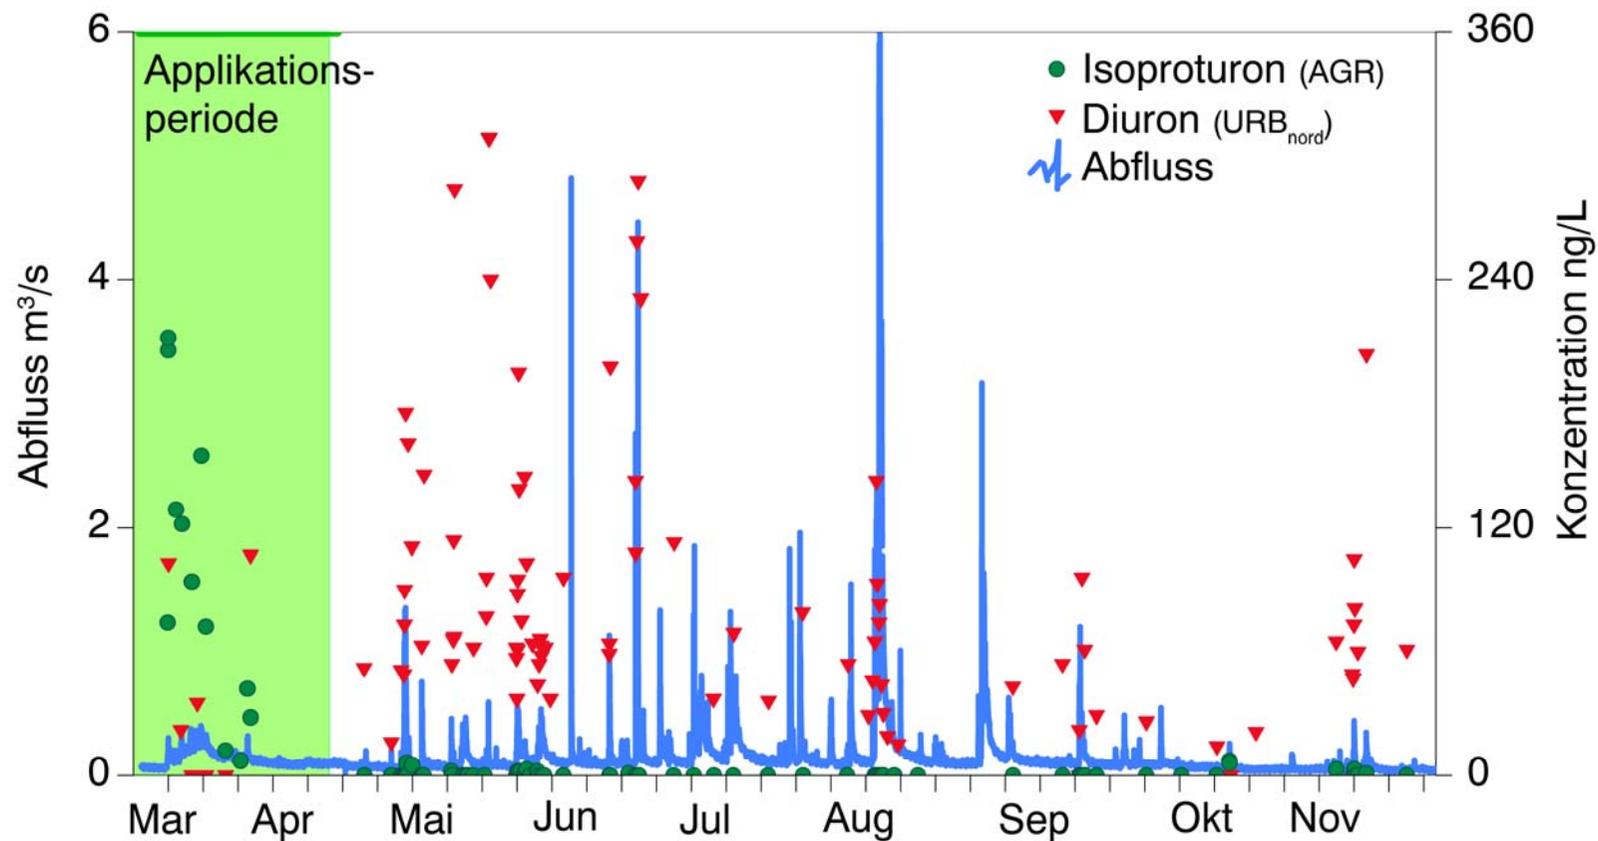

The **discharge dynamic** of the two catchments varies

**Atrazine**- concentrations usually increase with increasing discharge

**Mecoprop** – concentrations depend on the activity of the urban drainage system (CSO)

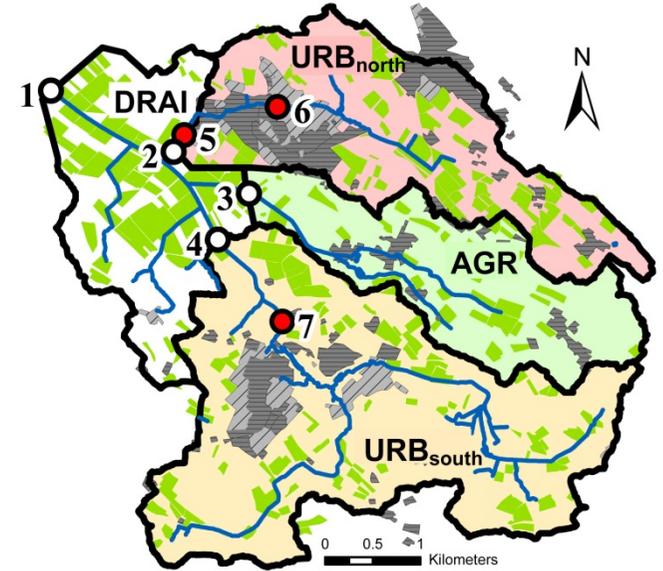

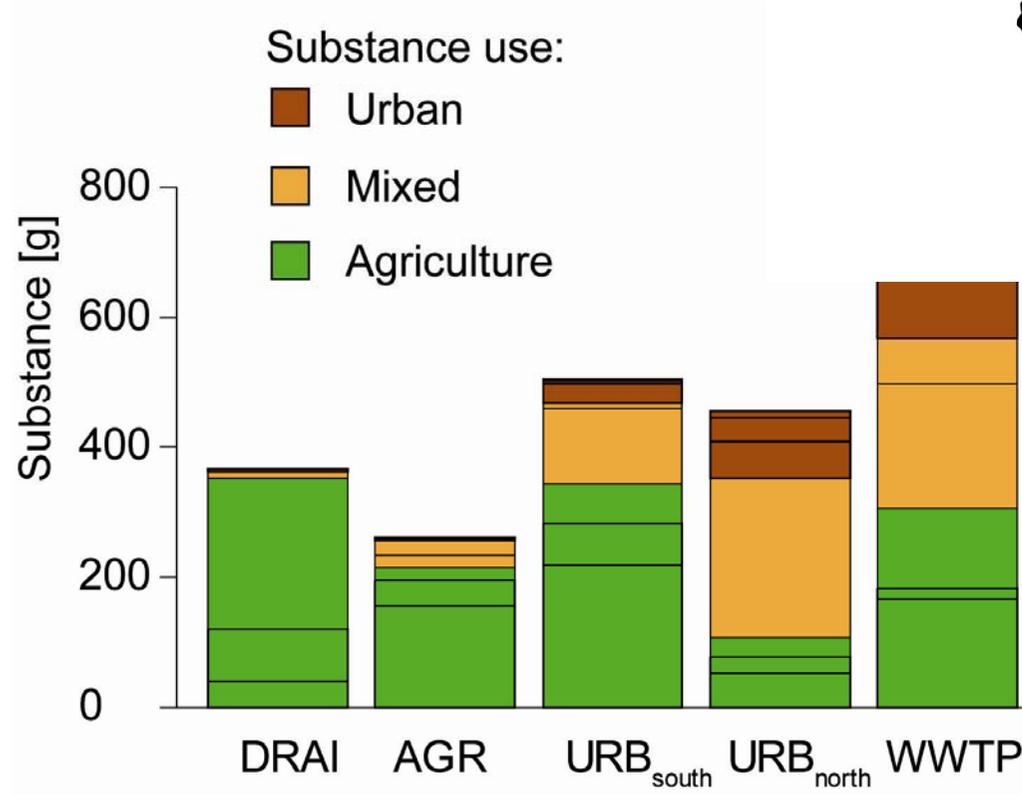

▼ Mecoprop conc.  
● Atrazine conc.

## Seasonal dynamics

Concentrations of agricultural pesticides are elevated during application seasons, biocides maybe constantly elevated.

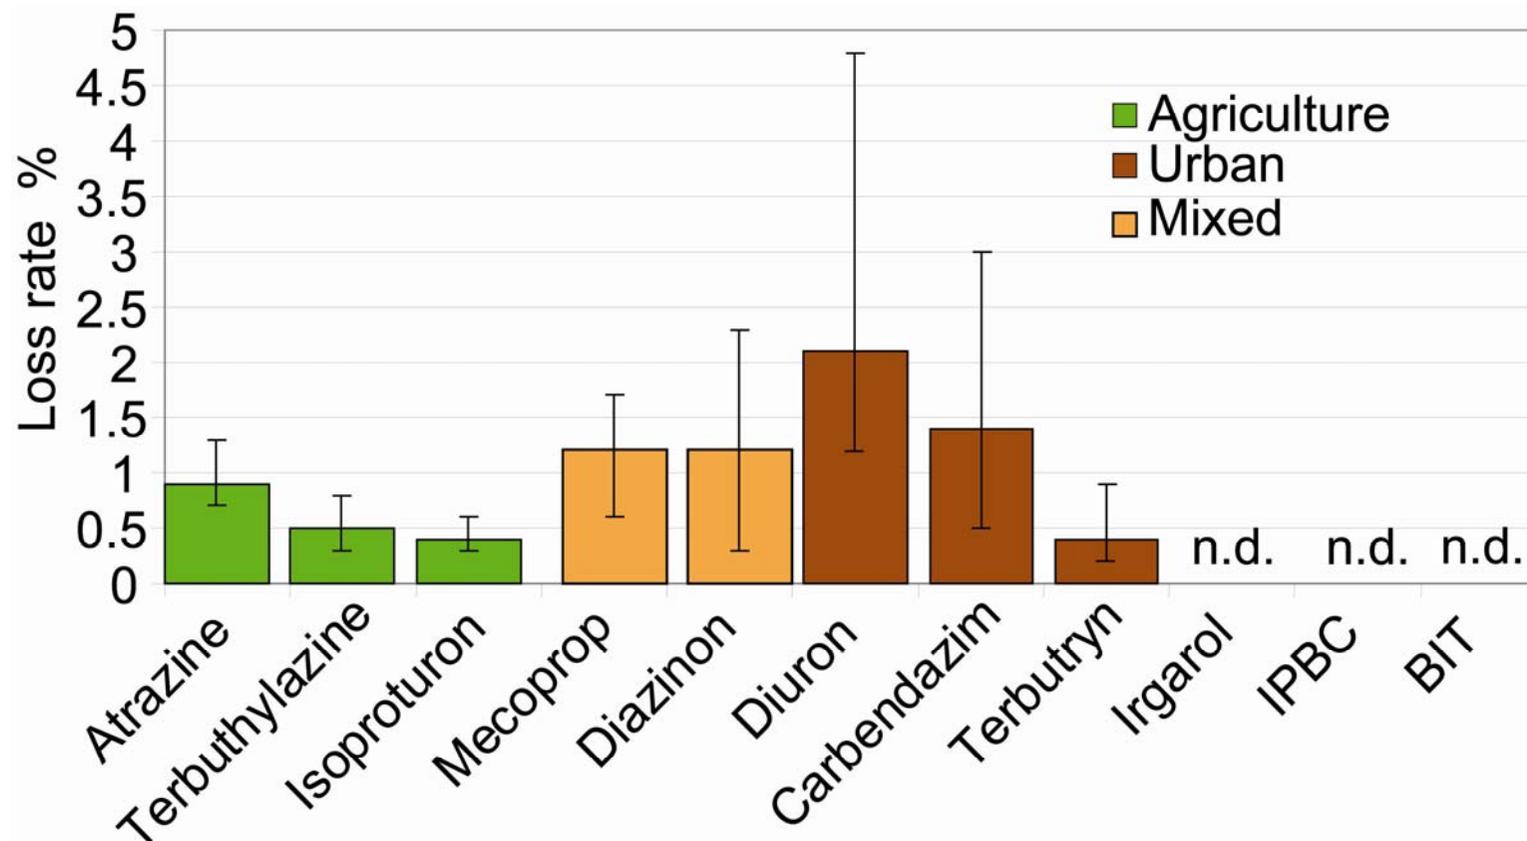

# Loads

Catchments show distinct load patterns depending on the land use!

## Loss rates

$$\text{Loss rate} = \frac{\text{Measured load}}{\text{Consumption}}$$

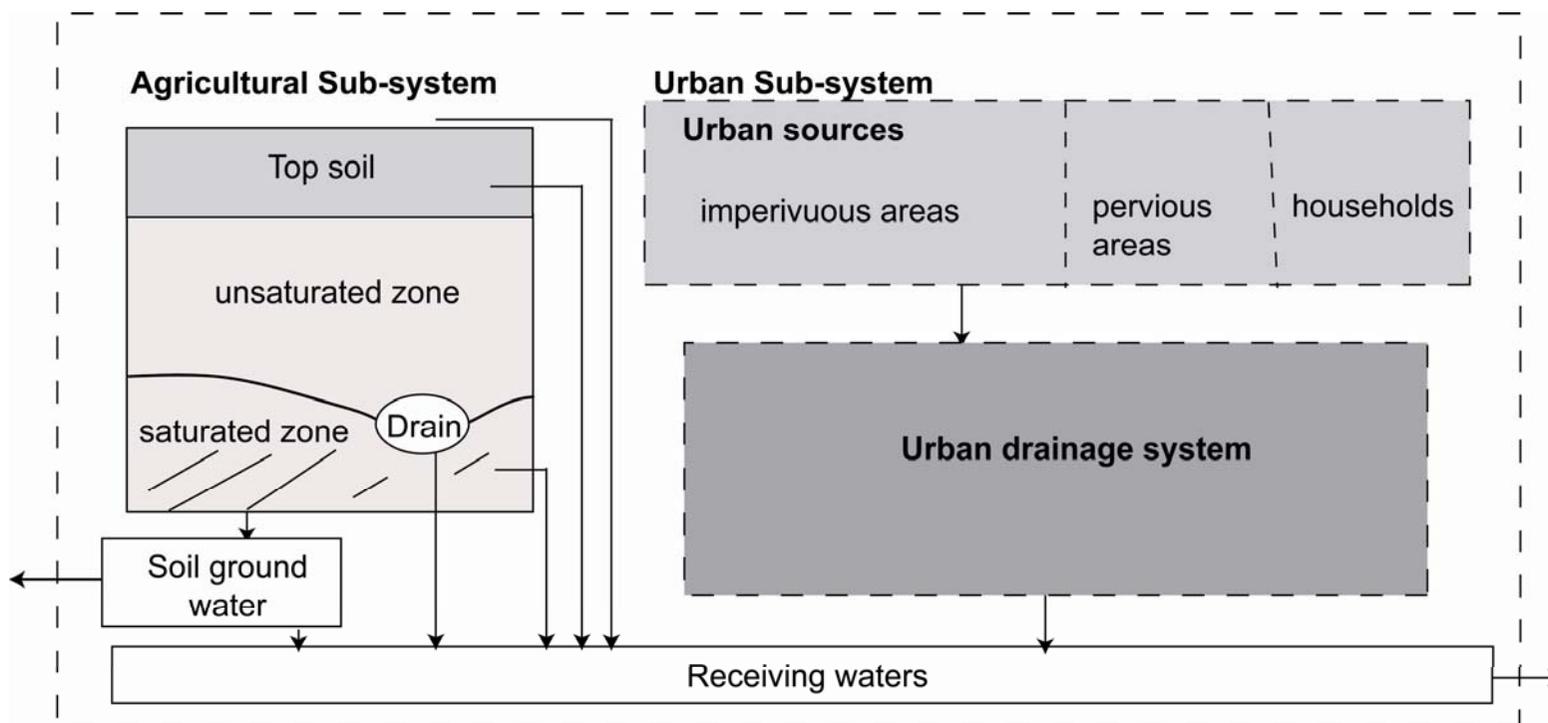

Loss rates of urban used compounds can be higher.

Some compounds with a high use were not detected.

# Modeling approach

## Agriculture

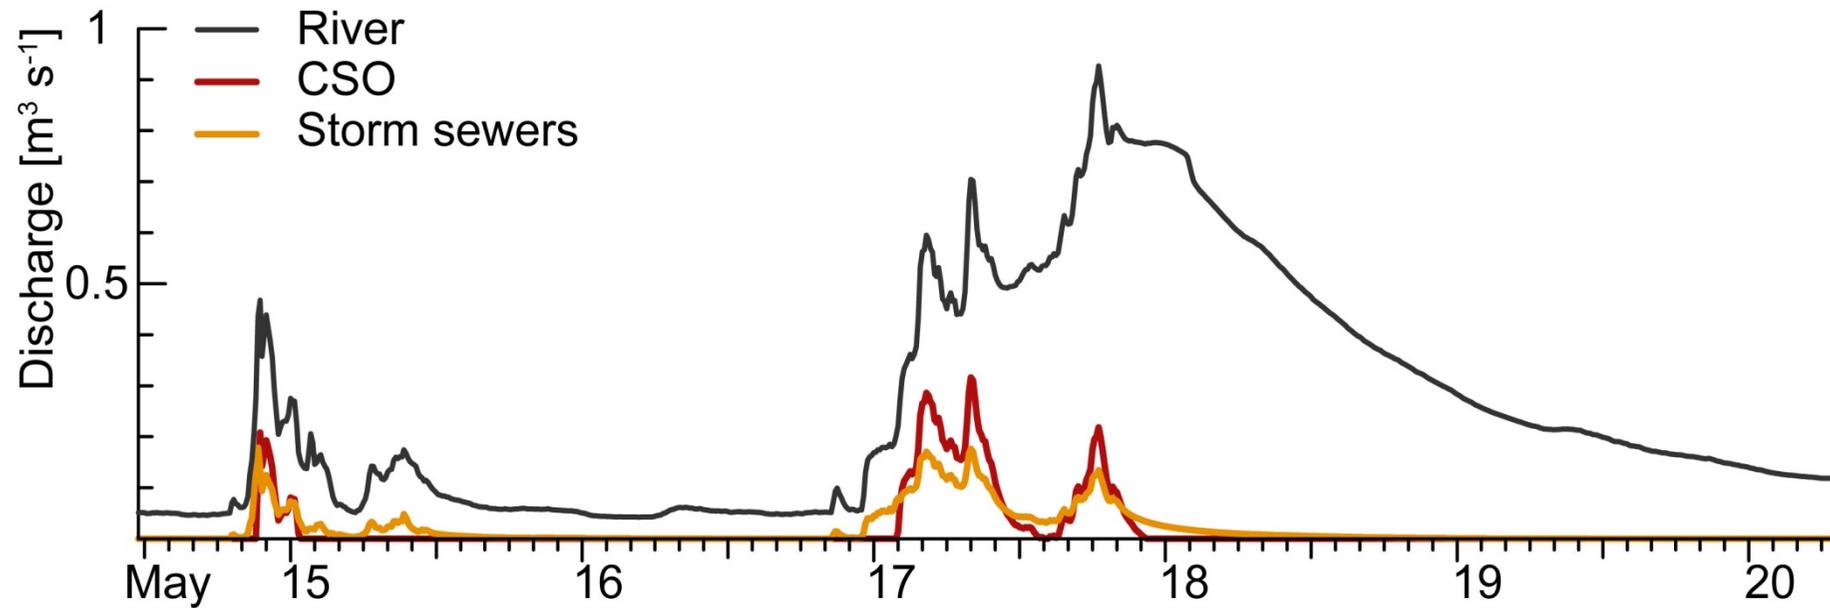

## Urban

- Model as simple as possible
- All relevant process and sources
- High temporal resolution (used: 15min)

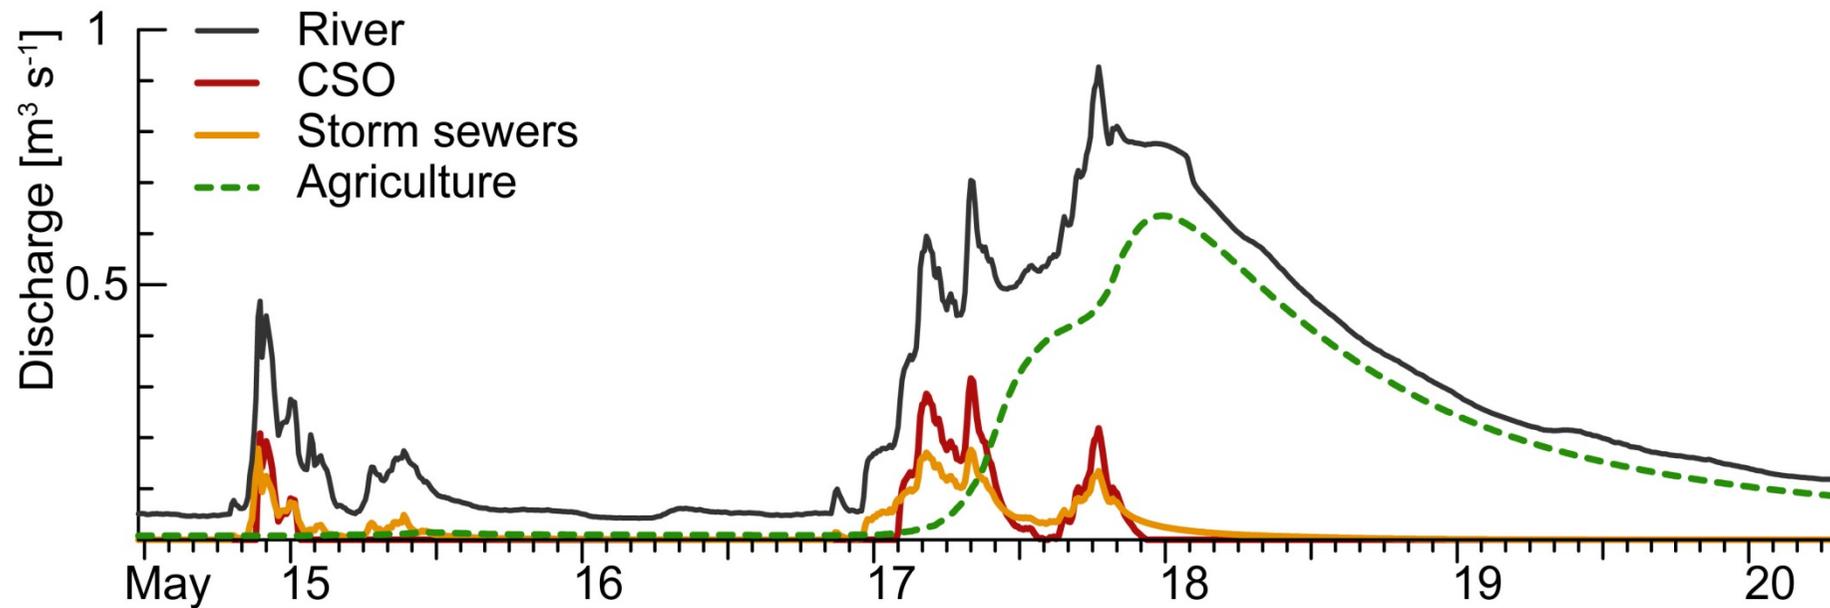

## Model Results

### Discharge components

## Model Results

### Discharge components

In the beginning discharge consists mostly of urban water  
Agricultural system does not always react to rainfall

## Conclusions

- Land use results in distinct chemical fingerprints (dynamic & occurrence)
- In the beginning of events river discharge consists mostly of urban storm water.
- Loss rates from urban uses can be higher.
- Knowledge about biocide consumption is limited.

**Agricultural as well as urban systems have to be considered!**

# Thank you for listening!

and

Thanks to Alfredo Alder, Carina Carlsson, Alfi Lück, Sylvia Jauss, Irene Hanke, Gabriel Popow, Christoph Moschet, Nina Mahler, Christoph Rudolph, Simone Bischofberger, Dominik Sonderegger for their co-work.

Thanks to Hans Wunderli (Bodenphysik ETHZ) und Peter Gäumann, Andi Raffainer, Arthur Scheiber of the Eawag workshop for their technical support.

Thanks to many nice people at Uchem and Eawag for help and the very good atmosphere!

Thanks to U.eli Kaufmann for the illustration of the system.

... and to Eawag and Awel for financing the project
