Dübendorf – 17.09.2014

Retrospective analysis of water samples

Retrospective monitoring is the analysis of archived human or environmental samples regarding timely and spacial occurrence, trends and fate of priority and emerging compounds

How to keep water samples for retrospective analysis?

solutions **norman**

 **HELMHOLTZ**
CENTRE FOR
ENVIRONMENTAL
RESEARCH - UFZ

Environmental specimen banks

- Rothamsted soil bank since 1846 [1]
- Systematic institutional and governmental human and environmental ESBs since 1960s (e.g. Sweden, Japan, USA, Germany) [2]
- International Environmental Specimen Group since 2013
- Matrices (examples from German ESB)
 - Fish, muscles (riverine, marine)
 - Suspended particulate matter (Rhine, Saar, Danube, Elbe, Mulde)

But: No storage of water samples

[1] Jones et al. 1988, [2] <http://www.inter-esb.org>

Environmental specimen banks

- Long-term archiving of environmentally representative samples
- Standardised work flows for whole sampling and archiving procedure to yield homogenous and integrative samples
- QS/QC processes to ensure long-term stability and integrity of the samples
- Availability of samples to perform retrospective analysis depends on experience, standing and performance of the the laboratory

<http://www.umweltprobenbank.de/en/>

Long-term storage of raw water samples is a challenge

- Homogeneity
- Contamination
- Stability (e.g. hydrolysis, biodegradation)
- Adsorption
- Filtration or not?
- Increasing volume of frozen samples
- ...

Not recommended!

Archiving of water samples on solid phases

- Passive sampling using POCIS [1]
 - Good stability of solid-phases under cryo-conditions (-160 °C in gas phase of liquid N₂)
 - No information on stability of compounds
- Solid phase extraction (of large volumes) of water samples
 - Good long-term stability of compounds at low temperatures [2]

Open questions:

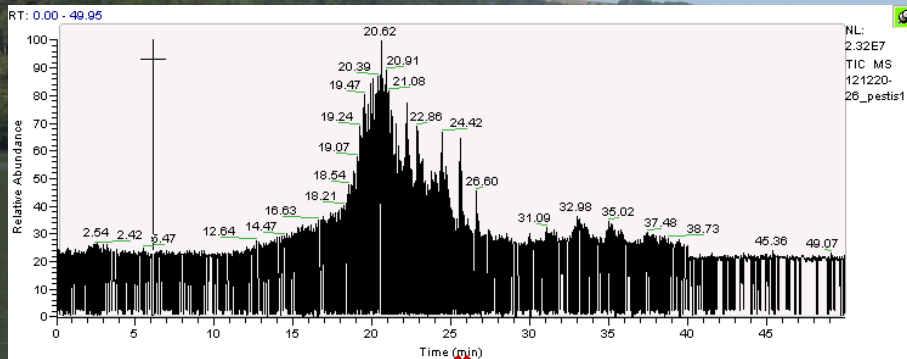

- Handling of SPE material (e.g. sticks to surfaces, homogeneity, freeze-drying)
- Representiveness (grab samples vs. integrative samples)
- Bias (selection of passive samplers and phases)

[1] Ricking et al. 2009; [2] Hillebrand et al. 2013

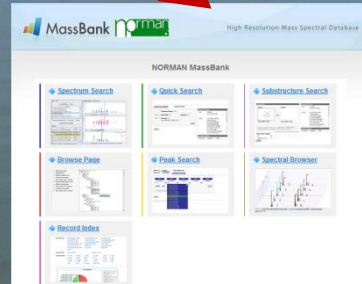

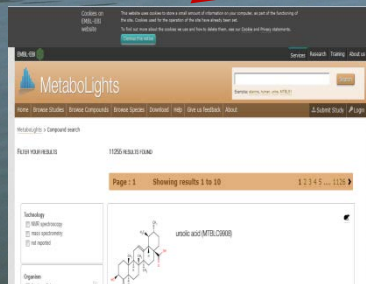

How to store water samples?

Storing of raw water samples is not recommended

HR-chromatograms of environmental samples could contain thousands of features

Usefulness of storing all mass spectral information in repositories such as MassBank or „Envirolights“?

The idea of the NORMAN digital storage is to archive whole chromatograms of water and other samples for retrospective analysis similar to ESBs in vendor's format

Why storing whole chromatograms?

- Software tools are in development (e.g. pick pickers)
- Important features might be not deconvoluted
- Exporting of chromatograms to open formats could yield in loss of information (wanted or unwanted)
- Users want to use raw data using sophisticated vendor's software for analysis

Requirements of a digital storage

- Archive storing files in **long-term**
- Support for large amounts of data (in the terabyte range)
- **Redundancy** to protect against data loss
- Verification of the stored data using checksums (**integrity**)
- Data description using a standardised metadata catalogue (e.g. Dublin Core, Inspire Core)
- Search and filter functions (e.g. location, matrix, river basin)
- Map view of dataset is an added value

 all data projects ▾

  Sample data  Logger data  Field management data  Archive data  Master data

Welcome to the Data Management Portal (DMP)

With this application you are able to **manage** scientific data from different areas:

- **Archive data** - File based archiving
 - **Sample data** - Sampling and analysis data workflow
 - **Logger data** - Automated transmission of measured values from sensors in the field
 - **Field management data** - Planning and history of agement on experimental fields
-
- Basic technology for storing large data files is available
 - Long-term archive, redundant, standardised meta-data (Dublin core)
 - Not implemented so far
 - Integration of sample data and archive
 - External user interface

Information about DataLog

In the course of time, the UFZ collects more and more data. These sometimes differ greatly from each other and are provided in different databases.

All these data have meta-information describing the single record. The aim of the DataLog is to help you search through this meta-information. By using this search, you can quickly search for specific data you need.

Requirements on the data submitted

- Chromatograms in raw format
- Additional vendors types files (e.g. reports)
- Additional information (e.g. spread sheets with evaluations in DCT format)
- Information on the methods used
- Data should be published under Creative Commons share alike license (CC BY SA)
- Metadata in standardised format (DCT, ISA-Tab, Inpire / Dublin core etc.)

- Long-term archiving is feasible
- Integrity of the data is warranted
- Coverage and quality of data is biased on methods / instrumentation
- Standardisation of data delivery
- Data accessible for the public without restrictions (CC BY SA)
