AIMS

- Bring together ECETOC scientists, regulatory experts and member company business development managers to explore how a science-based organisation such as ECETOC can help bring best scientific practices into the International Harmonisation of Chemical Regulation.
- Explore implications of ECETOC activities and how science understanding can add value to business activities in emerging markets.

STRUCTURE

The morning will provide an understanding of:

- Activities of ECETOC to meet current and anticipated (3 to 5-year time scale) scientific challenges in chemical risk assessment.
- How regulatory and business development managers see the scientific challenges particularly as we move to international harmonisation of chemical regulation.

The afternoon will focus on identifying where ECETOC science can help address challenges in the international harmonisation of chemical regulation. This will be achieved through breakout sessions where ECETOC scientists and regulatory experts will address a series of questions.

Answers to these questions will be consolidated and presented to the participants before the close of the meeting and shared with the ECETOC Board of Directors to aid their strategic planning with the focus on ensuring ECETOC continues to add value for the industry and the regulatory community in the area of chemical risk assessment.
